#### Acknowledgement

The authors would like to thank the Director General of Health Malaysia and the National Health and Morbidity Survey (NHMS) Steering Committee Team for supporting this research project via financial grant and technical support. The research team members would like to express their gratitude to the Director General of Education, Ministry of Education Malaysia, as well as the Director of Family Health Development Division and Director of Nutrition Division, Ministry of Health Malaysia. Our appreciation is also extended towards the various State Education Departments, District Education Offices, School Principals and the selected school officers who assisted in this study successfully. And last but not least, all students from 212 schools whom have participated in this study.

#### **Executive Summary**

The Adolescent Health Survey 2017 is aimed at assessing the prevalence of health risk behaviours and protective factors amongst secondary school students in Malaysia using self-administered anonymous questionnaires adapted from the Malaysian Global School-based Student Health Survey (GSHS) 2012. This study was conducted among secondary school-going adolescents between 26<sup>th</sup> March and 3<sup>rd</sup> May 2017. In order to ensure national representativeness, this study was implemented using a two-stage cluster sampling design. Out of 2738 secondary schools from the Ministry of Education and Ministry of Rural and Regional Development, 212 schools were selected and more than 30,000 students were eligible to participate in this survey. The overall response rate was 89.0% and 27,497 school-going adolescents completed the survey. A total of 14 secondary schools were randomly selected in Kelantan of which 1,631 students completed the survey out of 1,900 eligible respondents with response rate of 85.8%.

#### **Kelantan Key Findings**

The study observed that the prevalence of current cigarette smokers in Kelantan school-going adolescents was 16.5%. Amongst those who ever smoked cigarettes, 67.6% had tried cigarettes before the of age 14 years and 71.8% had attempted to quit smoking in the past 12 months. The prevalence of current e-cigarette/vape use in Kelantan school-going adolescents was 11.5%. Among those who ever smoked e-cigarette/vape, 35.4% had first tried e-cigarette/vape before age 14 years and 58.4% had tried to stop using e-cigarette/vape in the past 12 months. Overall, 16.1% of students reported having parents or guardians who used e-cigarette/vape, 51.6% of students reported having parents or guardians who used any form of tobacco products and 46.6% of students reported having been exposed to people who smoked in their presence in the past seven days. Prevalence of current alcohol drinkers among school-going adolescents in Kelantan was 6.5% in which alcohol sources were mainly from their own family. Among students who had ever consumed alcohol (9.3%), 38.5% reported ever drunkenness in their lifetime. With regards to drug use, 3.9% of students in Kelantan reported had ever used drugs and the prevalence of current drug users was 3.3%. Prevalence of ever using marijuana in their lifetime was 2.6% and current use of marijuana was 2.5%,

while 2.5% of students reported had ever used amphetamines or methamphetamines during their lifetime.

The study found that prevalence of ever having sex among school-going adolescents in Kelantan was 7.0% and the prevalence of having had sex in the past 30 days was 4.5%. Of those who ever had sex, 36.7% of them had their first sexual experience before age 14 years, and 23.3% had at least two sexual partners. It was found that 22.2% of students reported they, or their partners had used condoms whilst 14.9% used other birth control methods. A total of 30.9% students had been seriously injured in the past 12 months. Among the respondents, 21.8% claimed to have been physically attacked in the past 12 months, while 21.2% of adolescents claimed to have been involved in physical fights. With regards to bullying, 12.5% reported to have ever been bullied in the past 30 days. Physical abuse at home was reported by 8.8% of students while 42.1% of reported verbal abuse at home in the past 30 days.

The overall prevalence of internet use among school-going adolescents in Kelantan was 72.5% and the prevalence of internet addiction was 17.4%. Smartphones were the most prevalent device used. A total of 7.0% school-going adolescents in Kelantan reported feeling lonely and 2.8% reported that they had no close friend. A total of 4.5% reported being unable to sleep "most of the time or always" due to worry in the 12 months prior to the survey. Prevalence of suicidal ideation, plan and attempt were 6.4%, 4.4%, and 5.0% respectively. Prevalence of truancy amongst students in the past 30 days was 30.8% while only 45.9% claimed to have peer support. Students who reported having parental or guardian supervision, parental or guardian connectedness, parental or guardian bonding and parental or guardian respect for privacy were 14.5%, 33.5%, 40.4% and 75.2% respectively.

Overall, 86.4% of students reported having cleaned or brushed their teeth at least twice daily while 1.1% of students reported that they had never cleaned or brushed their teeth in the past 30 days. A total of 58.8% students reported use of fluoridated toothpaste, while only 13.1% used dental floss. In the past 30 days, 19.0% never or rarely used soap when washing their hands, 7.1% never or rarely washed their hands before eating and 10.1% reported that they had never or rarely washed their hands after using the toilet. In relation to dietary behaviours, 2.6% reported being hungry most of the time or always in the past 30 days because there was

not enough food at home. The consumption of fruits at least twice daily was 50.8% and consumption of vegetables at least thrice daily was 30.1% in the past 30 days. Only 20.8% of students reported fruits and vegetables consumption at least five times daily in the past 30 days. Consumption of carbonated soft drinks of at least once daily in the past 30 days was reported at 35.4% and 6.7% consumed food from fast food restaurants for at least three days in the past seven days. Milk/milk products consumption of at least two servings per day was reported at 24.2% while 55.4% drank plain water five times or more per day in the past 30 days. Prevalence of being physically active for a total of at least 60 minutes daily for five days or more in the past seven days was 17.4% whereas 39.8% of students had spent at least three hours in a typical or usual day in sitting activities.

#### **Malaysia Key Findings**

The study observed that the prevalence of current cigarette smokers in school-going adolescents was 13.8%. Amongst those who ever smoked cigarettes, 68.4% had tried cigarettes before the age of 14 years and 71.0% had attempted to quit smoking in the past 12 months. The prevalence of current e-cigarette/vape use in school-going adolescents was 9.8%. Among those who ever smoked e-cigarette/vape, 42.2% had first tried e-cigarette/vape before age 14 years and 60.9% had tried to stop using e-cigarette/vape in the past 12 months. Overall, 13.7% of students reported having parents or guardians who used e-cigarette/vape, 42.2% of students reported having parents or guardians who used any form of tobacco products and 42.0% of students reported having been exposed to people who smoked in their presence in the past 7 days. Prevalence of current alcohol drinkers among school-going adolescents was 10.2% in which alcohol sources were mainly from their own family or bought from stores. Among students who had ever consumed alcohol (19.3%), three quarter had their first alcoholic beverage before age 14 years and 31.9% reported ever drunkenness in their lifetime. With regards to drug use, 4.3% of students reported had ever used drugs and the prevalence of current drug users was 3.4%. Prevalence of ever using marijuana in their lifetime was 2.8% and current use of marijuana was 2.5%, while 2.4% of students reported had ever used amphetamines or methamphetamines during their lifetime.

The study found that prevalence of ever having sex among school-going adolescents was 7.3% and the prevalence of having had sex in the past 30 days was 5.4%. Of those who ever had sex, 31.9% of them had their first sexual experience before age 14 years, and 16.6% had at

least two sexual partners. It was found that 12.7% of students reported they, or their partners had used condoms whilst 10.3% used other birth control methods. A total of 29.9% students had been seriously injured in the past 12 months with two most common causes of injury being falls and motor vehicle accidents. Among respondents, 25.3% claimed to have been physically attacked in the past 12 months, while 24.9% of adolescents claimed to have been involved in physical fights. With regards to bullying, 16.2% reported to have ever been bullied in the past 30 days. The two most common forms of bullying were 'being made fun of because of how their body or face looks' and 'made fun of with sexual jokes, comments or gestures'. Physical abuse at home was reported by 11.8% of students while 43.2% reported verbal abuse at home in the past 30 days.

The overall prevalence of internet use among school-going adolescents was 85.6% and the prevalence of internet addiction was 29.0%. Smartphones were the most prevalent device used. A total of 9.3% secondary school students in Malaysia reported feeling lonely and 3.6% reported that they had no close friend. A total of 7.1% reported being unable to sleep "most of the time or always" due to worry in the 12 months prior to the survey. Prevalence of suicidal ideation, plan and attempt were 10.0%, 7.3%, and 6.9% respectively. Prevalence of truancy amongst students in the past 30 days was 29.4% and only 44.2% claimed to have peer support. Students who reported having parental or guardian supervision, parental or guardian connectedness, parental or guardian bonding and parental or guardian respect for privacy were 13.2%, 32.0%, 42.6%, and 74.4% respectively.

Overall, 87.1% of students reported having cleaned or brushed their teeth at least twice daily while 1.2% of students reported they had never cleaned or brushed their teeth in the past 30 days. A total of 58.3% students reported use of fluoridated toothpaste, while only 19.3% used dental floss. In the past 30 days, 11.6% never or rarely used soap when washing their hands, 6.1% never or rarely washed their hands before eating and 4.8% reported that they had never or rarely washed their hands after using the toilet. In relation to dietary behaviours, 3.9% reported being hungry most of the time or always in the past 30 days because there was not enough food at home. The consumption of fruits at least twice daily was 46.8% and consumption of vegetables at least thrice daily was 36.0% in the past 30 days. Only 23.5% reported fruits and vegetables consumption at least five times daily in the past 30 days.

Consumption of carbonated soft drinks of at least once daily in the past 30 days was reported at 36.9% while 11.1% consumed food from fast food restaurants for at least three days in the past seven days. Milk/milk products consumption of at least two servings per day was reported at 31.0% while 60.4% drank plain water five times or more per day in the past 30 days. Prevalence of being physically active for a total of at least 60 minutes daily for five days or more in the past seven days was 19.8% whereas 50.1% of students had spent at least three hours in a typical or usual day in sitting activities.

#### Recommendations:

In view of the above findings, the following recommendations are suggested:

- To strenghten awareness, knowledge and practice of positive health-related behaviours through home, school and community settings.
- To develop and disseminate more health education materials on health risk behaviours, its consequences and preventive measures.
- To enhance resilience and coping skills among students through school and community programs and activities such as, Doktor Muda, Minda Sihat, cadets and volunteerism.
- To strengthen protective factors against risky behaviours through intersectoral collaboration with more emphasis on spiritual values and parenting skills.
- Intersectoral collaboration to tackle the social determinants contributing to the adolescent health morbidities and mortalities.
- To evaluate the effectiveness of adolescent health programs provided by various agencies at a regular interval.

#### 1.0 INTRODUCTION

The World Health Organization (WHO) has defined adolescents as a group of population between the ages of 10 to 19 years.<sup>1</sup> Adolescence sub-categories used in Malaysia consists of early adolescence (10-14 years), middle adolescence (15-17 years) and late adolescence (18-19 years).<sup>2</sup> Total population of adolescents in Malaysia is around 18% out of 31 million population.<sup>3</sup> Adolescents are the most valuable asset in the country as they will become future leaders who will continue to sustain our national agendas.

By definition, adolescence is a period of transition from childhood to adulthood where significant changes occur in the form of physical appearance as well as emotional well-being. Rapid biological maturity precedes psychosocial maturity, thus having an impact on health consequences.<sup>4</sup> Generally, they are perceived as the healthiest population and often overlooked until now. However previous studies had observed multiple morbidities among adolescents resulting from unintentional injuries, risky behaviours such as smoking, use of alcohol and drugs and also involvement in sexual activity.<sup>5</sup> The current trend of the cyber era, in which more adolescents spend too much time "on line" and have become addicted to the internet, results in detachment from the real world and difficulties adapting with real world communication, which is later associated with mental health problems among adolescents.<sup>6</sup> Physical inactivity and unhealthy dietary behaviors are associated with obesity and these behaviours may continue until adulthood. The practice of good personal hygiene care and dietary behaviours are equally important aspects that should not be put aside in assessing adolescent health.<sup>5</sup> Their interaction with the environment also shapes adolescent growth through psychosocial experiences where peer and parental support play an important role. Adolescents are at-risk of premature morbidity and mortality if no preventive measures are taken.<sup>7</sup> This population should enjoy the highest attainable standards of health with a supportive environment.

#### 1.1 Research in Adolescent Health in Malaysian Context

In Malaysia, the Adolescent Health Unit has been established in 1995 under the Family Health Development Division, Ministry of Health, Malaysia.<sup>3</sup> In terms of research activities, a nationwide health risk behavior study among adolescents was conducted in 1996 with four

main scopes namely smoking, alcohol consumption, drug use and sexual activity practices.<sup>8</sup> Following that, the Global Youth Tobacco Surveys were conducted in 2003 and 2009 to identify tobacco consumption among youth.<sup>9,10</sup> In 2010, the Institute for Health Behavioural Research had initiated The Youth Behaviour Risk Factor Surveillance (YBRFS), however the respondents only consisted of students from Forms 1, Form 2 and Form 4.<sup>11</sup> In realizing that the national data on health risks and behaviours are very much important in developing policy and programs for adolescents, the Ministry of Health, Malaysia took a step forward in collaborating with the World Health Organization (WHO) inconducting the Global Schoolbased Student Health Survey (GSHS) Malaysia in 2012. The survey used a self-administered questionnaire assessing 10 main scopes of adolescent health risk behaviours primarily among students aged 13 to 17 years. The GSHS questionnaire was developed by WHO and the Center for Disease Control and Prevention (CDC) in collaboration with UNICEF, UNESCO, and UNAIDS in 2001. It has been used as a standard tool by more than 100 countries in the world. Local adaption and validation of the questionnaire was done before running the actual nationwide survey.<sup>12</sup>

The purpose of the GSHS was to provide accurate data on health behaviours and protective factors among students to:

- Help countries develop priorities, establish programmes, and advocate for resources for school health and youth health programmes and policies;
- Establish trends in the prevalence of health behaviours and protective factors for use in evaluation of school health and youth health promotion; and
- Allow countries, international agencies, and others to make comparisons across countries and within countries regarding the prevalence of health risk behaviours and protective factors.

#### The 10 main scopes were:

- Alcohol use
- Dietary behaviours
- Drug use
- Hygiene (including oral health)
- Mental health problems

- Physical activity
- Protective factors
- Sexual behaviours that contribute to HIV infection, other STI, and unintended pregnancy
- Tobacco use
- Violence and unintentional injury

With regards to the importance of serial data in measuring the trends of health risk behaviours among adolescents in Malaysia, the Ministry of Health has listed the Adolescent Health Survey as one of the main scopes in the National Health and Morbidity Survey (NHMS) cycle. The current Adolescent Health Survey used a similar methodology and validated Malaysian GSHS questionnaire in 2012 with the addition of the Malay Version Internet Addiction Test (MVIAT).<sup>13</sup>

#### 1.2 Objectives

#### 1.2.1 General Objectives

To assess the prevalence of health risk behaviours among adolescents in Malaysia in order to review health priorities, program strategies and activities and planning for allocation of resources for adolescent health.

#### 1.2.2 Specific Objectives

- 1.2.2.1 To identify the prevalence of alcohol use
- 1.2.2.2 To identify the dietary behaviors
- 1.2.2.3 To identify the prevalence of drug use
- 1.2.2.4 To identify the practice of hygiene including oral health
- 1.2.2.5 To identify the prevalence of internet use and addiction
- 1.2.2.6 To identify the prevalence of mental health problems
- 1.2.2.7 To identify the practice of physical activity
- 1.2.2.8 To identify the prevalence of protective factors
- 1.2.2.9 To identify the prevalence of sexual behaviours
- 1.2.2.10 To identify the prevalence of tobacco use
- 1.2.2.11 To identify the prevalence of violence and unintentional injury

#### 1.2.3 The NHMS 2017 Organisation Team

The organisation of NHMS 2017 was set up at various levels of the Ministry of Health and Minstry of Education in order to conduct this survey.

#### 1.2.3.1 NHMS Steering Committee

The NHMS Steering Committee, chaired by the Director-General of Health was set up at the national level to approve scopes of the NHMS 2015-2018 and to facilitate implementation of the survey.

The members and terms of reference of this committee are shown in Appendix 1 and 2.

#### 1.2.3.2 Central Coordinating Team (CCT)

A working committee within the Institute for Public Health was established to coordinate implementation of the survey according to the scheduled Gantt chart. The Operation Centre was set up and led by the CCT team for coordinating and monitoring progress of the survey.

The list of CCT members and terms of reference are shown in **Appendix 3 and 4**. Figure 1 detailed the organisation chart at the Institute for Public Health level. Adolescent Health Survey was part of NHMS 2017 using the sample from secondary schools only.

#### 1.2.3.3 Research Team Members

Research team members for each sub-scope were established and headed by a key-person (among IPH officers) together with the relevant stakeholders. Research team members were responsible for the technical input in development of the questionnaire manual, variable definition, data analysis and writing of the final report.

The list of members for each research teams are shown in **Appendix 5.** 

#### 1.2.3.4 State Liason Officers and Data Collection Team.

A State Liaison Officer was appointed in each State to facilitate planning and implementation of data collection within the States.

The list of State Liaison Officers and Data Collection Teams are shown in **Appendix 6.** 

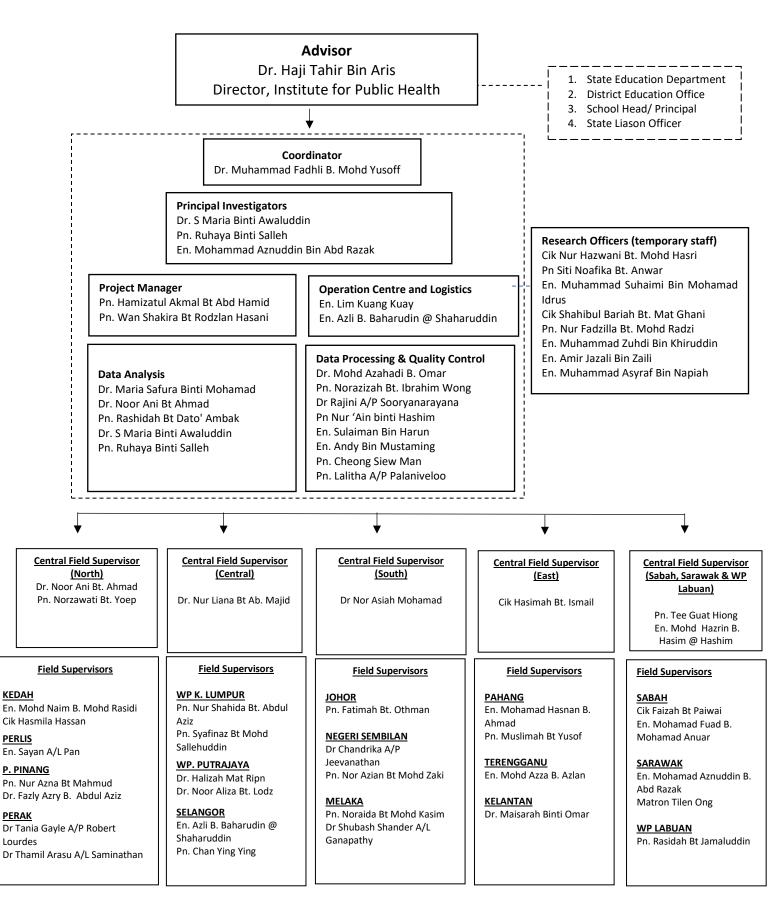

Figure 1: Organisation chart for data collection teams NHMS 2017

#### 2.0 METHODOLOGY AND SAMPLING DESIGN

#### 2.1 Target Population

The target population for the Adolescent Health Survey 2017 was school-going adolescents aged between 13 to 17 years in Malaysia. An equal sampling proportion was calculated from 13 States and three Federal Territories to represent adolescents in each State / Federal Territories.

#### 2.2 Sampling Frame

The sampling frame used in this survey was the list of secondary schools from the Ministry of Education and Ministry of Rural and Regional Development. Students' enrolment data of Form 1 to Form 5 from 2,738 secondary schools in 2016 were used.

#### 2.3 Sample Size Determination

Sample size was calculated by using a single proportion formula for estimation of prevalence.

The sample size calculation was based on a few criteria as stated below:

- Variance of proportion of the variable of interest (Based on Global School-Based Student Health Survey 2012)
- 2. Margin of error (e) (Between 0.01 to 0.05)
- 3. Confidence Interval of 95%

To obtain an optimum sample size, a few adjustments were made to the sample size calculation as follows:

1. Adjusted n (srs) for total number of target population (N) (based on the population size for school-going adolescents in 2016)

$$n \ge \frac{n_{SRS}}{1 + \frac{n_{SRS}}{N}}$$

- 2. Adjusted for design effect (deff) (based on previous survey: GSHS 2012), n (complex) = n \* deff
- Adjusted for n(complex) taking into account expected non-response rate of 25%, n (adj) = n (complex) \* (1 + non-response rate)

4. The sample size was adjusted according to the needs of analysis; at the national or state level.

Based on the requirements to achieve the objectives of the survey and above mention considerations, the optimum sample size required was 30, 496 respondents (**Table 2.1**).

Table 2.1: Distribution of Secondary Schools Sampled by State, NHMS 2017

No.	State / Federal	<b>Total Number</b>	Number of	Number of	
	Territories	of Schools	Schools	students	
			Sampled	sampled	
1	Johor	306	14	1,906	
2	Kedah	219	14	1,906	
3	Kelantan	193	14	1,906	
4	Melaka	87	14	1,906	
5	Negeri Sembilan	139	14	1,906	
6	Pahang	209	14	1,906	
7	Pulau Pinang	141	14	1,906	
8	Perak	275	14	1,906	
9	Perlis	33	14	1,906	
10	Selangor	345	14	1,906	
11	Terengganu	162	14	1,906	
12	Sabah	246	14	1,906	
13	Sarawak	220	14	1,906	
14	WP Kuala Lumpur	133	14	1,906	
15	WP Labuan	19	8	1,906	
16	WP Putrajaya	11	8	1,906	
	Total	2,738	212	30,496	

#### 2.4 Sampling Design

This survey utilised a two-stage stratified cluster sampling design to ensure representativeness of students from Form 1 to Form 5 (13-17 years). Malaysia was stratified into 16 states/ Federal Territories. The first stage of sampling was selection of secondary schools (schools with students from Forms 1 to Form 5). Schools were selected randomly with probability proportionate to school enrolment size. A total of 212 secondary schools were selected to participate in this survey. The second stage of sampling was selection of classes. All classes in each selected school were included in the sampling frame. Systematic random sampling was used to select minimum of four to maximum of 10 classes from each selected school to meet the required sample for each school in 13 states and WP Kuala Lumpur, WP Putrajaya and WP Labuan; 137 and 239 respondents respectively. All students in selected classes were eligible to participate in the survey.

#### 2.5 Ethical Approval and Consent Forms

This study had obtained approvals from the Medical Research and Ethics Committee of the Ministry of Health and Ministry of Education. We obtained permission to carry out the survey from relevant offices of the Ministry of Education at state and district levels as well as from schools selected. Prior to the survey, several meetings with relevant Ministry of Education officers and persons in-charge at selected schools were conducted to ensure readiness in logistic preparation. Teachers were briefed on the parent's consent form, who then distributed it to parents a week prior to the survey. During the actual day of the survey, student's consent was obtained from eligible respondents before survey was conducted. Students who did not receive parental consent or they themselves refused to participate were considered as non-response of eligible participants in this survey.

#### 2.6 Survey Instruments

A validated self-administered bilingual questionnaire adopted from the Malaysian GSHS 2012 with computer-scan-able answer sheets was used. Answer sheets were anonymous to ensure student confidentiality. Majority of the students completed the survey within two teaching periods. The Adolescent Health Questionnaires contained 77 questions addressing the following topics:

- Alcohol use
- Dietary behaviours
- Drug use
- Hygiene (including oral health)
- Internet Use and Addiction
- Mental health
- Physical activity
- Protective factors
- Sexual behaviours that contribute to HIV infection, other STIs, and unintended pregnancy
- Tobacco use
- Violence and unintentional injury

#### 2.7 Data Collection

There were 36 teams to collect data; 4 teams each for Sabah and Sarawak and 2 teams per state in the Peninsular Malaysia and Federal Territories. Each team consisted of a field supervisor, research assistants and a driver. The field supervisor was a permanent staff in the Ministry of Health.

A pilot study was carried out on 6 February 2017. Data collection training was conducted in Kuala Lumpur and Kuching, Sarawak for data collection teams in Peninsular Malaysia, and for Sabah, Sarawak and WP Labuan respectively. The training module comprised of questionnaires and role-plays in handling the survey in classrooms or in a school hall. Data collection was from 26 March to 3 May 2017.

#### 2.8 Data Management

Quality check on data was conducted throughout the survey based on specific identification (ID) numbers; from the state ID until individual student ID (generated for the study). Upon completing the survey, each student placed his / her answer sheet in an envelope. All answer sheets from the same school were wrapped together to make a bundle. These bundles were

collected by assigned drivers for schools in Peninsular Malaysia or using tracked postage for schools in Sabah, Sarawak and WP Labuan.

#### 2.8.1 Data Operation Centre

An operation centre with several stations was set up to receive data "bundles" from the field:

Station 1: Respondent ID checking

Station 2: Scanning

Station 3: Verification

Station 4: Storage

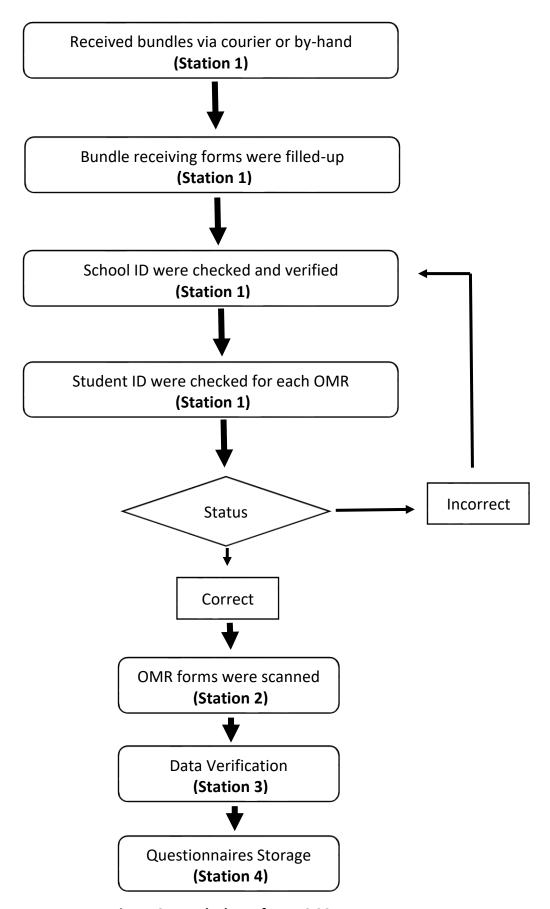

Figure 2: Work Flow of NHMS 2017

#### 2.8.2 Data Analysis

Analysis was prepared according to objectives of the survey, working definitions and dummy tables. IBM SPSS Statistics for Windows, Version 21.0. (Armonk, NY: IBM Corp.) was used to import raw datasets in Excel form. Data set was checked and cleaned for any inconsistencies. The final data analysis was conducted by using complex sampling design and 95% confidence interval.

A weighting factor was applied to each student record to adjust for non-response and for varying probabilities of selection. Weight estimation was calculated by the following formula:

#### $W = W1 \times W2 \times F \times PS$

Where;

**W1** = the inverse of probability of selecting the school

**W2** = the inverse of probability of selecting the class within the school

**F** = the inverse of a school, class and student level non-response adjustment factor

**PS** = a post stratification adjustment factor calculated by class and gender

The weighted results were used to make important inferences on the health risk behaviours and protective factors of all students from Form 1 to Form 5. Variable definitions used in this survey were derived from the Malaysian GSHS 2012 and was discussed in detail for each scope.

## 3.0 FINDINGS

# 3.1 General Findings

A total of 27,497 OMR forms were received from 212 selected schools. The overall response rate was 89.2%. The response rates for schools and classes were 100% each, while the response rate for students was 89.2%. (**Table 3.1.1**).

Table 3.1.1: Response Rate at Student Level by State, NHMS 2017

Ctata	Selected	Eligible	Completed	Response rate
State	Schools	students	OMR forms	(%)
Johor	14	1,915	1,731	90.4
Kedah	14	1,930	1,691	87.6
Kelantan	14	1,900	1,631	85.8
Melaka	14	1,986	1,872	94.3
Negeri Sembilan	14	1,930	1,718	89.0
Pahang	14	1,948	1,784	91.6
Pulau Pinang	14	1,974	1,749	88.6
Perak	14	1,931	1,754	90.8
Perlis	14	1,992	1,667	83.7
Selangor	14	1,840	1,671	90.8
Terengganu	14	1,880	1,669	88.8
Sabah	14	1,965	1,686	85.8
Sarawak	14	1,919	1,779	92.7
WP Kuala Lumpur	14	1,937	1,721	88.8
WP Labuan	8	1,907	1,712	89.8
WP Putrajaya	8	1,869	1,662	88.9
Total	212	30,823	27,497	89.2

Comparison of total estimated population (weighted) with the national secondary school enrolment is shown in **Table 3.1.2** Geographic information system (GIS) on the mapping of selected secondary schools is shown in **Figure 3** The socio-demographic characteristics of the sample by gender consist of 49.4% (806) males and 50.6% (825) females in Kelantan . In terms of school locality; 23.7% (387) and 76.3% (1,244) were students studying in school located in urban areas and rural areas respectively.

Table 3.1.2: Comparison between NHMS 2017 respondents and national enrolment of secondary school students in Malaysia 2017

		NHMS 2017	National Enr	olment 2017

## 3.2 Alcohol Consumption

Contributors: Tania Gayle Robert, Hamizatul Akmal Abd Hamid, Halizah Mat Rifin, Mohd Hatta Mutalip, Norli Abdul Jabbar, Rozanim Kamaruddin, Muhammad Fadhli Mohd Yusoff, Thamil Arasu Saminathan, Jane Ling Miaw Yn, Wan Shakira Rodzlan Hasani, Hasimah Ismail, Nur Liana Abdul Majid

#### 3.2.1 Introduction

Globally, there are about 3.3 million deaths attributable to harmful use of alcohol annually. The South East Asian region contributed to 4.6% of alcohol-attributable deaths and 4.0% burden of disease and injury. People consuming alcohol are prone to more than 200 diseases and injuries as well as social consequences due to its harmful effects. The Centre for Disease Control (CDC) estimates on average in the United States from 2006 to 2010, there were 4,358 alcohol-attributable deaths due to excessive alcohol use for those under 21; 1,580 deaths from motor vehicle crashes, 1,269 as a result of homicides, 492 from suicide, as well as 245 from other injuries such as falls, burns, and drowning. Alarmingly, about 33% of teens (by age 15) have had at least 1 drink of an alcoholic beverage. Evidently, individuals who started drinking before the age of 15 are five times more likely to have alcohol-related problems later in life. The consequence of early alcohol drinking could lead to memory impairment, thus causing low educational achievement and high absenteeism rates. See

## 3.2.2 Objectives

- i. To determine the prevalence of ever and current drinkers among students from Form1 to Form 5.
- ii. To describe the socio-demographic characteristics of ever and current drinkers among students from Form 1 to Form 5.
- iii. To identify the age of alcohol drinking initiation among students from Form 1 to Form
- iv. To identify the sources of obtaining alcoholic beverages among students from Form 1 to Form 5.
- v. To identify the prevalence of drunkenness among students from Form 1 to Form 5 who consume alcohol.

vi. To determine the frequency of social problems related to alcohol consumption among students from Form 1 to Form 5.

#### 3.2.3 Variable definitions

- Drinking alcohol: A "drink" is a glass of wine, tuak, lihing, bahar, ijuk or toddy; a can
  of beer, a small glass of liquor' or mixed drink. Drinking alcohol does not include
  drinking a few sips of wine for religious purposes.
- Ever drinkers: Those who had a history of alcohol consumption in their lifetime.
- Current drinkers: Those who had at least a "drink" of alcohol in the past 30 days.
- **Drunkenness:** When someone demonstrates signs such as staggering when walking, not being able to speak right and throwing up after consuming alcohol in a lifetime.
- **Social problems**: Having trouble with family or friends, missed school or got into fights as a result of drinking alcohol in a lifetime.

## 3.2.4 Findings

The prevalence of ever alcohol drinkers among students from Form 1 to Form 5 in Kelantan was 9.3% (95% CI: 6.29, 13.60) and it was significantly higher among students who attended rural schools (10.6%, 95% CI: 7.20, 15.30) compared to those who attended urban schools [4.0% (95% CI: 2.76, 5.85)]. However, there was no significant difference noted across sex and form (Table 3.2.1). The prevalence of current alcohol drinkers among students from Form 1 to Form 5 was 6.5% (95% CI: 4.16, 10.01) (Table 3.2.2). Among ever alcohol drinkers, 38.5% (95% CI: 22.74, 57.16) reported drunkenness and the prevalence was higher among students who attended rural schools [41.6% (95% CI: 24.97, 60.46)] compared to those who attended urban schools [4.7% (95% CI: 0.78, 24.05) (Table 3.2.3).

Among students who ever consumed alcohol, 19.3% (95% CI: 11.95, 29.75) had their first alcoholic beverage at the age of 8 or 9 years, 14.5% (95% CI: 8.33, 24.04) had their first alcoholic beverage at the age of 12 or 13 years and 14.4% (95% CI: 9.57, 20.99) at the age of 7 years old or younger (Table 3.2.4). Among current alcohol drinkers, most of them bought alcoholic beverages from stores (47.3, 95% CI: 31.93, 63.30) (Table 3.2.5). The prevalence of students getting into trouble with their family and friends, missed school or got into fights

one or more times as a result of drinking alcohol was 4.0% (95% CI: 2.08, 7.71) and there was no significant difference by school locality and sex (Table 3.2.6).

# 3.2.5 Discussion/ Conclusion

The prevalence of ever alcohol drinkers among students from Form 1 to Form 5 in Kelantan was 9.3% (95% CI: 6.29, 13.60), which was lower compared to the national prevalence [19.3% (95% CI: 17.10, 21.70)]. For current alcohol drinkers, the prevalence was 6.5% (95% CI: 4.16, 10.01, whereas the national prevalence was 10.2% (95% CI: 9.00, 11.60). Among current alcohol drinkers in Kelantan, most of them bought their alcoholic beverages from stores (47.3, 95% CI: 31.93, 63.30), contrary to the national data where most of them obtained their alcoholic beverages from their families [(37.7% (95% CI: 33.26, 42.25)].

#### 3.2.6 Recommendations

Addressing alcohol drinking among adolescents in Malaysia is vital to prevent social and other harmful effects of alcohol on the health of adolescents. Mapping of localities with high alcohol drinking and drunkenness prevalence is highly recommended, since alcohol use is not rampant and localised in specific populations and locations.

By doing this, interventions can be focused on the identified groups. Among the interventions that can be implemented are:

- 1. To instill awareness about the danger of underage drinking to the adolescents as early as possible.
- 2. Family-based prevention programmes: Educating parents on the negative effects of alcohol especially on long-term memory and learning skills, health effects and its social repercussions on adolescent behaviour and subsequent dependence and abuse if not controlled. Parents should play an important role as the firsthand educators on the harmful effects of alcohol to their children and prohibiting children to initiate early alcohol drinking.
- School-based prevention programmes: Empower counselors and teachers to screen their students for alcohol use and to start intervention for these students as soon as possible.

## 3.3. Dietary Behaviours

Contributors: Rashidah Ambak, Syafinaz Mohd Sallehuddin, Norlida Zulkafly, Ruhaya Salleh, Cheong Siew Man, Mohamad Hasnan Ahmad, S. Maria Awaluddin, Rusidah Selamat

#### 3.3.1 Introduction

Fruits and vegetables are good sources of complex carbohydrates, vitamins, minerals, and other substances important for adolescent's good health. Dietary patterns that include higher intakes of fruits and vegetables are associated with several health benefits, including a decreased risk for some types of cancer.

## 3.3.2 Objectives

To describe the prevalence of:

- i. Students who had gone hungry most of the time or always in the past 30 days.
- ii. Fruits intake of at least twice daily in the past 30 days.
- iii. Vegetables intake of at least three times daily in the past 30 days.
- iv. Fruits and vegetables intake of at least five times daily in the past 30 days.
- v. Carbonated drinks consumption of at least once daily in the past 30 days.
- vi. Plain water intake of five times or more daily in the past 30 days.
- vii. Milk or milk products intake of at least two times daily in the past 30 days.
- viii. Food consumption from fast food restaurant of at least three days in the past seven days

### 3.3.3 Variable Definitions

- Gone hungry: students who had gone hungry most of the time or always because
  there was not enough food at home for the past 30 days or living without financial
  means to access enough food for active and healthy living.
- **Fruits intake**: fruits intake of at least twice daily in the past 30 days, inclusive of various types of local fruit, seasonal fruit and imported fruit.
- Vegetables intake: vegetables intake of at least three times daily in the past 30 days,
   either eaten raw or cooked.
- Plain water intake: Includes mineral water, boiled water, or tap water
- Carbonated drinks intake: carbonated drinks consumption of at least once daily in the past 30 days (except mentioned as diet soft drinks).
- Dairy products intake: milk or milk products intake at least two times daily in the past 30 days.
- Fast food intake: consuming food from fast food restaurants at least three days in the past seven days

### 3.3.4 Findings

## Hunger

The overall prevalence of students who reported being hungry most of the time or always in the past 30 days was 2.6% (95% CI: 1.65, 4.20) with an estimated projection to 3,216 school-going adolescents. In terms of school locality, there was no significant difference reported between students studying in the urban areas (1.4%; 95% CI: 0.46, 4.30) and students from the rural areas (2.9%; 95% CI: 1.81, 4.74). There were 2.5% (95% CI: 1.28, 4.85) of male students and 2.8% (95% CI: 1.74, 4.39) female students who reported being hungry (**Table 3.3.1**).

## Fruits intake

The overall prevalence of consuming fruits at least twice daily in the past 30 days was 50.8% (95%CI: 46.26, 55.41) with an estimated projection to 61,783 school-going adolescents. In terms of school locality, the prevalence of consuming fruits at least twice daily among urban and rural school-going adolescents was 55.2% (95% CI: 44.56, 65.40) and 49.8% (95% CI:

44.95, 54.66) respectively. There were 49.5% (95% CI: 44.18, 54.79) male students and 52.1% (95% CI: 45.81, 58.42) female students who reported consuming fruits at least twice daily (Table 3.3.2).

## Vegetables intake

The overall prevalence of consuming vegetables at least three times daily in the past 30 days was 30.1% (95%CI: 26.20, 34.30) with an estimated projection to 36,589 school-going adolescents. In terms of school locality, the urban school-going adolescents significantly had lower prevalence of vegetables at least three times daily at 23.6% (95% CI: 23.02, 24.23) compared to the students in the rural areas at 31.6% (95% CI: 27.30, 36.30). There were 30.5% (95% CI: 27.20, 33.98) male students and 29.7% (95% CI: 24.20, 35.89) female students who reported consuming vegetables at least twice daily. Form 2 students reported the lowest 27.3% (95% CI: 20.08, 36.04) prevalence of consuming vegetable at least thrice daily as compared with other forms (Table 3.3.3).

## Fruits and vegetables intake at least five time daily

A total of 20.8% (95% CI: 17.70, 24.20) students in Kelantan reported consuming fruits and vegetables at least five times daily in the past 30 days with an estimated projection to 25,225 school-going adolescents. There was no difference in fruits and vegetables intake at least five times daily by school locality, sex and form **(Table 3.3.4)**.

## Carbonated soft drinks intake

The overall prevalence of consuming carbonated drinks at least once daily in the past 30 days was 35.4% (95%CI: 28.33, 43.16) with an estimated projection to 42,987 school-going adolescents. In terms of school locality, the urban school-going adolescents who reported carbonated drinks consumption at least once daily was 25.5% (95% CI: 16.36, 37.50) while 37.8% (95% CI: 30.08, 46.10) in rural areas. The prevalence of male students was 43.1% (95% CI: 34.85, 51.86) as compared to the females at 27.9% (95% CI: 22.12, 34.62). Form 1 students [42.3% (95% CI: 35.11, 49.84)] and Form 3 students [40.4% (95% CI: 27.98, 54.17)] reported the highest prevalence of consuming carbonated drinks at least once daily in the past 30 days as compared to other forms (Table 3.3.5).

#### Plain water intake

The overall prevalence of drinking plain water five times or more daily in the past 30 days was 55.4% (95%CI: 50.86, 59.78) with an estimated projection to 53,936 school-going adolescents. In terms of school locality, the prevalence of drinking plain water five times or more daily in the past 30 days among urban and rural school-going adolescents was 48.7% (95% CI: 42.31, 55.23) and 43.6% (95% CI: 38.65, 48.77) respectively. The prevalence of male students was 40.4% (95% CI: 35.42, 45.54), as compared to the females at 48.7% (95% CI: 41.47, 56.02). Form 1 students reported the lowest prevalence of drinking plain water five times or more daily 37.0 % (95% CI: 28.73, 46.03) as compared to other forms (Table 3.3.6).

## Milk and milk products intake

The overall prevalence of milk or milk products intake of at least two times daily in the past 30 days was 24.2% (95%CI: 20.48, 28.34) with an estimated projection to 29,442 school-going adolescents. There was no difference in milk and milk products intake by school locality and sex. Form 4 students [21.4% (95% CI: 15.36, 28.88)] and Form 5 students [22.7% (95% CI: 19.01, 26.85)] reported the lowest milk or milk products intake as compared to other forms (Table 3.3.7).

### Fast food intake

The overall prevalence of consuming food from fast food restaurants of at least three days in the past seven days was 6.7% (95%CI: 5.13, 8.76) with an estimated projection to 8,171 school-going adolescents. There was no difference in milk and milk products intake by school locality, sex and forms. (Table 3.3.8).

## 3.3.5 Discussion/ Conclusion

The prevalence of being hungry most of the time or always during the past 30 days in Kelantan AHS 2017 [2.6% (95% CI: 1.65, 4.20)] was lower compared to the national prevalence in 2017 [3.9% (95% CI: 3.53, 4.24)], and lower from the previous Kelantan GSHS 2012<sup>1</sup> [3.4% (95% CI: 2.24, 5.28)]. The prevalence of consuming fruits at least twice daily in Kelantan AHS 2017 [50.8% (95%CI: 46.26, 55.41) was higher compared to the national prevalence in 2017 [46.8%

(95% CI: 45.09, 48.53)], and comparable to Kelantan GSHS 2012<sup>1</sup> [50.1% (95% CI: 44.32, 55.90)]. The prevalence of vegetable consumption in Kelantan AHS 2017 [30.1% (95%CI: 26.20, 34.30)] was significantly lower compared to the national prevalence in 2017 [36.0% (95% CI: 34.45, 37.52)], and comparable to Kelantan GSHS 2012<sup>1</sup> [29.9% (95% CI: 26.62, 33.29)]. The prevalence for fruits and vegetables intake at least five times per day in Kelantan AHS 2017 [20.8% (95%CI: 17.70, 24.20)] was lower compared to the national prevalence in 2017 [23.5% (95% CI: 22.20, 24.94)], and also significantly lower compared to Kelantan GSHS 2012<sup>1</sup> [30.6% (95% CI: 27.33, 34.17)]. The prevalence for carbonated drink consumption once daily in Kelantan AHS 2017 [35.4% (95%CI: 28.33, 43.16)] was lower compared to the national prevalence in 2017 [36.9% (95% CI: 35.04, 38.79)], and higher than the Kelantan GSHS 2012<sup>1</sup> [29.7% (95% CI: 26.00, 33.72)]. The prevalence for plain water drinking five times or more daily in the past 30 days in Kelantan AHS 2017 [55.4% (95%CI: 50.86, 59.78)] was lower compared to the national prevalence in 2017 [60.4% (95% CI: 59.07, 61.78)], and higher than the Kelantan GSHS 2012<sup>1</sup> [46.2% (95% CI: 39.32, 53.17)]. The prevalence for fast food consumption from fast food restaurants of at least three days in the past seven days in Kelantan AHS 2017 [6.7% (95%CI: 5.13, 8.76)] was significantly lower than the national prevalence in 2017 [11.1% (95% CI: 10.24, 12.01)], but higher than the Kelantan GSHS 2012<sup>1</sup> [4.0% (95% CI: 2.67, 6.06)].

## 3.3.6 Recommendations

In view of the findings highlighted above, Malaysian students need more attention towards a healthy eating habit. Parents play an important role to ensure that healthy and nutritious food such as fruits, yogurt, and high fibre snacks are available on shelves and in fridges at home. Appropriate nutrition education program with creative and innovative approaches should be carried out in promoting healthy diet, specifically eating more fruits and vegetables, drinking more plain water, consuming more milk/milk products and reducing fast food intake and carbonated soft drinks intake. Further research should be conducted to identify underlying causes of food insecurity and unhealthy eating habits among students in Malaysia.

## 3.4 Drug Use

Contributors: Muhammad Fadhli Mohd Yusoff, Rushidi Ramly, Wan Shakira Rodzlan Hasani, Hasimah Ismail, Hamizatul Akmal Abd Hamid, Norli Abdul Jabbar, Jane Ling Miaw Yn, Halizah Mat Rifin, Tania Gayle Robert, Thamil Arasu Saminathan, Nur Liana Ab. Majid.

### 3.4.1 Introduction

According to the World Drug Report 2017, an estimated quarter of a billion people, or around five per cent of the global adult population, used drugs at least once in 2015. Even more worrisome is the fact that about 29.5 million of those drug users, or 0.6 percent of the global adult population, suffer from drug use disorders. This means that their drug use is harmful to the point that they may experience drug dependence and require treatment.

Marijuana or cannabis remains the world's most widely used drug, with an annual prevalence of 3.8 per cent of the adult population, or an estimated 183 million people (range 128 million to 238 million), having used marijuana in the past year.<sup>2</sup> Amphetamines remain the second most commonly used drug worldwide, with an estimated 35 million past-year users (range 13 million to 58 million), and the use of amphetamines, particularly methamphetamine, is perceived to be increasing in many regions, including most parts of Asia.

This drug menace contributes to various social and medical ill health implications particularly among adolescents. The broad range of problems reported by young people include deteriorating family relations, truancy, poorer performance in school, mental disorders such as depression and anxiety, drug induced psychosis particularly with the New Psychoactive Substances (NPS), unwanted and unprotected sexual activity, accidents, violence and increased risk of blood-borne viral diseases such as HIV and Hepatitis C for those injecting drug users (IDU). Some youth engaging in heavy substance use will continue to do so into adulthood and will experience various longer-term health and social problems.

# 3.4.2 Objectives

- To determine the prevalence of ever and current drug use among Form 1 to Form 5 students
- ii. To describe the socio-demographic characteristics of ever and current drug use amongForm 1 to Form 5 students
- iii. To determine the prevalence of ever and current marijuana use among Form 1 to Form5 students
- iv. To describe the socio-demographic characteristics of ever and current marijuana use among Form 1 to Form 5 students
- v. To determine the prevalence and socio-demographic characteristics of ever amphetamines or methamphetamines use among Form 1 to Form 5 students
- vi. To identify the age of initiation and the sources of obtaining drugs among Form 1 to Form 5 students

## 3.4.3 Variable Definitions

- **Drug use:** taking of heroin, morphine, glue, amphetamine or methamphetamines (ecstasy, syabu, ice), marijuana/ganja (except prescribed medicine).
- Ever drug use: students who had history of drug use in their lifetime
- Current drug use: students who used drugs in the past 30 days
- Ever Marijuana use: students who had history of marijuana use in their lifetime
- Current Marijuana use: students who used marijuana in the past 30 days
- Ever Amphetamine or Methamphetamines use: students who had history of amphetamine or methamphetamines use in their lifetime.

## 3.4.4 Findings

Overall, the prevalence of ever drug use among students from Form 1 to Form 5 in Kelantan was 3.9% (95% CI: 2.01, 7.39) with an estimated population of 4,735 students. The prevalence of ever drug use was highest among those who studying in rural areas [4.6% (95% CI: 2.42, 8.60)], male students [6.3% (95% CI: 3.26, 11.82)] and among Form 2 students [7.2% (95% CI: 2.70, 18.02)] (Table 3.4.1). The prevalence of current drug use in the past 30 days among Form 1 to Form 5 students in Kelantan was 3.3% (95% CI: 1.50, 6.95). The prevalence of current drug use was significantly higher in rural areas [3.9% (95% CI: 1.82, 8.19)] as compared to urban areas [0.5% (95%CI: 0.17, 1.53)]. The prevalence of current drug users was highest among males [5.1% (95% CI: 2.32, 10.86)] and Form 2 students [7.0% (95% CI: 2.49, 18.08)] (Table 3.4.2). The prevalence of ever used marijuana in lifetime was 2.6% (95% CI: 1.28, 5.26) among Form 1 to Form 5 students in Kelantan (Table 3.4.3) and 2.5% (95% CI: 1.04, 5.70) were current marijuana users in the past 30 days (Table 3.4.4). About 2.5% (95% CI: 1.13, 5.47) of students reported that they had ever used amphetamines or methamphetamines during lifetime (Table 3.4.5).

Among current drug users, most students obtained their drugs by buying from someone [28.5% (95% CI: 15.39, 46.57)]. Other than that, they gave someone else money to buy it [19.8% CI: 9.43, 37.04), stole it or got without permission [17.0% (95%CI: 10.38, 26.72)] and they also obtained drugs from their family [10.1% (95% CI: 5.96, 16.52)] **(Table 3.4.6)**. Among ever drug users, about 0.7% (95% CI: 0.28, 1.71) had initiated drug use at the age of 7 years or younger with percentage of rural areas was 0.9% (95% CI: 0.36, 2.03) **(Table 3.4.7)**.

## 3.4.5 Discussion/ Conclusion

The prevalence of ever drug use and current drug use in Kelantan does not differ with the national prevalence. However, the prevalence of current drug use was significantly higher among those who studying in rural areas. As for ever marijuana use, current marijuana use and ever used of amphetamines or methamphetamine, there are no significant differences of the prevalence between national and Kelantan. Among those who ever used drug, majority

of students admitted that they had been using drugs at the age of 7 years or younger. Most of those who were current drug users had obtained their drugs by buying from someone.

## 3.4.6 Recommendations

Prevention and control measures of drug use among adolescents in Malaysia needs to be strengthened and started early from the primary school level. New strategies and approaches must be developed to address this issue. Health education and the dangers of drug abuse should be emphasized. Early detection and intervention also needs to be given priority.

## 3.5 Hygiene (Including Oral Health)

Contributors: Yaw Siew Lian, Natifah Che Salleh, Nurrul Ashikin Abdullah, Ting Teck Pei, Mohamad Fuad Mohamad Anuar, Sayan a/l Pan, Norazizah Ibrahim Wong.

#### 3.5.1 Introduction

Dental caries has substantial impact to children, families, and health systems, including dental and medical consequences, loss of working time on the part of caregivers and increased expenditures. It is a multi-factorial infectious disease that leads to pain and infection, consequently affecting the quality of life, general health, productivity and educational performance of the child.<sup>1</sup> Daily tooth brushing with a fluoridated toothpaste and regular dental check-up at least once a year can help prevent dental caries and periodontal disease.

Clean hands can stop spread of parasites from one person to another. These parasites consume nutrients from children they infect, causing abdominal pain and can impair learning by slowing cognitive development. Hand washing is one of the most effective ways to prevent the spread of parasites, especially during these key times: before, during and after preparing food, before eating and after using the toilet.<sup>2,3</sup>

## 3.5.2 Objectives

To describe the prevalence of:

- i. Tooth brushing frequency in the past 30 days
- ii. Fluoridated toothpaste usage
- iii. Dental floss usage
- iv. Timing of last visit to a dentist or dental nurse
- v. Having missed class due to toothache in the past 12 months
- vi. Avoidance of smiling or laughing due to the appearance of their teeth
- vii. Using soap during hand washing in the past 30 days
- viii. Hand washing before eating in the past 30 days
- ix. Hand washing after using the toilet in the past 30 days

### 3.5.3 Variable Definitions

- Clean or brush teeth: Regular tooth brushing using toothbrush and toothpaste to keep the mouth, teeth and gums clean and healthy
- Last saw a dentist or dental nurse: Seen a dentist or dental nurse for a check-up,
   scaling or other dental treatment

## 3.5.4 Findings

## Cleaning or brushing teeth during the past 30 days

Overall, only 1.1% (95%CI: 0.53, 2.30)] of students reported they had never cleaned or brushed their teeth during the past 30 days. About 2.7% (95%CI: 1.74, 4.30) reported they had cleaned or brushed their teeth less than once daily and 9.7% (95%CI: 8.06, 11.74) had cleaned or brushed their teeth once daily during the past 30 days. About 86.4% (95%CI: 84.25, 88.29) of students reported they had cleaned or brushed their teeth at least twice daily (**Table 3.5.1**).

## Use of fluoridated toothpaste

Overall, only 58.8% (95%CI: 50.42, 66.65) of students reported use of fluoridated toothpaste and 13.3% (95%CI: 9.04, 19.25) claimed they were not using fluoridated toothpaste. About 27.9% (95%CI: 22.86, 33.55) of students reported not knowing whether their toothpaste contained fluoride (**Table 3.5.2**).

## Use of dental floss for cleaning teeth

Overall, only 13.1% (95%CI: 10.46, 16.32) of students reported that they use dental floss for cleaning their teeth and 86.9% (95%CI: 83.68, 89.54) claimed that they do not use dental floss to clean their teeth (**Table 3.5.3**).

### Last dental visit

Overall, only 45.1% (95%CI: 36.51, 54.08) of students reported that they had their last dental visit (inclusive of both dental treatment and dental check-up) in the past 12 months. The prevalence of students who had their last dental visit between 12-24 months was 9.6% (95%CI: 7.48, 12.13) while those with last dental visit more than 24 months was 5.7% (95%CI:

4.32, 7.53). About 10.6% (95%CI: 7.76, 14.42) of students had never ever had a dental visit while a substantial proportion [29.0% (95%CI: 23.60, 35.11)] did not know when was their last dental visit (**Table 3.5.4**).

## Missing class or school due to toothache

Overall, 10.2% (95%CI: 7.28, 14.13) of students had missed class or school due to toothache in the past 12 months (**Table 3.5.5**).

## Avoid smiling or laughing due to the appearance of their teeth

Overall, 16.5% (95%CI: 14.66, 18.50) of students reported that they avoided smiling or laughing due to the appearance of their teeth (**Table 3.5.6**).

## Use of soap when washing hands during the past 30 days

Overall in the past 30 days, about 19.0% (95%CI: 15.83, 22.68) of students never or rarely used soap when washing their hands, 30.3% (95%CI: 27.16, 33.66) reported they had only used soap sometimes when washing their hands while only 50.7% (95%CI: 46.05, 55.28) had always used soap when washing their hands. The prevalence of students who had never or rarely used soap when washing their hands was higher in males [23.8% (95%CI: 20.18, 27.91)] than females [14.4% (95%CI: 10.75, 19.02)] and also among students in Form 1 [25.8% (95%CI: 19.19, 33.68)] than in Form 5 [12.2% (95%CI: 9.06, 16.31)] (**Table 3.5.7**).

## Washing hand before eating during the past 30 days

Overall in the past 30 days, about 7.1% (95%CI: 5.22, 9.63) of students never or rarely washed their hands before eating, 8.8% (95%CI: 6.24, 12.14) reported they had sometimes washed their hands before eating while a high proportion of students [84.1% (95%CI: 79.39, 87.95) had always washed their hands before eating. The prevalence of male students [12.4% (95%CI: 8.74, 17.26)] who had sometimes washed their hands before eating was higher than females [5.3% (95%CI: 3.89, 7.10)] (**Table 3.5.8**).

## Washing hand after using the toilet or latrine during the past 30 days

Overall in the last 30 days, about 10.1% (95%CI: 7.93, 12.67) of students reported they had never or rarely washed their hands after using the toilet, 13.1% (95%CI: 11.14, 15.42) reported

they had only washed their hands sometimes after using the toilet while 76.8% (95%CI: 73.74, 79.63) of students claimed that they had always or most of the times washed their hands after using the toilet (**Table 3.5.9**).

## 3.5.5 Discussion/ Conclusion

The above findings related to the hand hygiene and oral hygiene practices of students in the age group of 13-17 years in Kelantan. Overall, the prevalence of students who had cleaned/brushed their teeth less than one time per day during the past 30 days in this survey was slightly higher (2.7%) as compared to the national prevalence (2.4%). This survey also found that the proportion of students (58.8%) using fluoridated toothpaste was almost similar to the national prevalence (58.3%), but slightly lower than the findings for Kelantan (59.5%) in GSHS 2012.<sup>4</sup> The prevalence of students who did not know whether their toothpaste contained fluoride (27.9%) was lower than the national prevalence (31.8%); as well as the findings for Kelantan (28.5%) in GSHS 2012.<sup>4</sup> The proportion of students who reported using dental floss to clean their teeth was significantly lower (13.1%) than the national prevalence (19.3%). The use of dental floss to clean their teeth among the students in Kelantan was not studied in the first Malaysian GSHS in 2012.

This survey also found that the prevalence of students who never or rarely used soap when washing their hands (19.0%) during the past 30 days was higher than the national prevalence (11.6%), but slightly lower than the findings for Kelantan (20.1%) in GSHS 2012.<sup>4</sup> The prevalence of students who never or rarely washed their hands before eating (7.1%) was higher than the national prevalence (6.1%) and the findings for Kelantan (4.5%) in GSHS 2012.<sup>4</sup> In this study, the prevalence of students who never or rarely washed their hands after going to the toilet (10.1%) was two times higher than the national prevalence (4.8%) and slightly higher than the findings for Kelantan in GSHS 2012 (9.8%).<sup>4</sup>

Overall, the findings on oral hygiene and hand hygiene practises of school students in the age group of 13-17 years in Kelantan showed that there is still room for further improvement. In terms of oral hygiene, during the past 30 days before the survey, about 3 in 100 of students had cleaned/brushed their teeth less than once per day and only 6 in 10 students had used

fluoridated toothpaste. The prevalence of students who had used dental floss for cleaning their teeth was very low (1 in 10 students). In terms of hand hygiene during the past 30 days, about 1 in 5 students reported that they had never or rarely used soap when washing their hands, about 7 in 100 students never or rarely washed their hands before eating and 1 in 10 students never or rarely washed their hands after going to the toilet.

#### 3.5.6 Recommendations

Taking cognizance of these findings, there is a need to emphasis on promoting hygiene among school-going adolescents through attitude and behavioural changes in maintenance of personal hygiene. Thus, the following recommendations are made:

- 1. More effort is needed to strengthen health education on oral and hand hygiene habits in schools and at home.
- 2. There is a need to further promote toothpaste literacy in our oral health promotion efforts.
- 3. Surveillance of hygiene habits and practices among adolescents need to be continued at regular intervals.
- 4. Further studies are recommended to study the factors contributing to poor hygiene habits among adolescents.

## 3.6 Internet Use and Addiction

Contributors: S. Maria Awaluddin, Normala Ibrahim, Chan Ying Ying, Rimah Melati Abd. Ghani, Amal Shamsudin, Wan Salwina Wan Ismail, Norharlina Bahar, Saidatul Norbaya Buang, Nik Rubiah Nik Abd. Rashid.

## 3.6.1 Introduction

Internet use has grown rapidly in Malaysia parallel with an increasing number of households having computers and mobile gadgets that are linked to internet access. It has been reported that the increase in internet use is more pronounced in urban than in rural areas. Major online activities include information seeking for educational, vocational and socializing purposes. Internet usage affects both adult and adolescent age groups equally compared to older age group.¹ Internet usage could be harmful to adolescents when it is not monitored or supervised by an adult. Uncontrolled use of internet has been linked to psychosocial problems such as addiction to online gaming, pornographic websites and social networking sites, not to mention exposing the adolescents to cyber-bullying environments. Excessive internet use and cyber bullying may in turn further worsen the mental health condition of these adolescents and predisposed them to depression, anxiety and stress.²

The terminology of internet addiction to describe excessive internet use has been debated and various tools have been developed to measure the internet addiction. The most widely used tool was the Internet Addiction Test (IAT) developed by Kimberly S. Young.<sup>3</sup> The questionnaire consists of 20 items measured using a 5-point Likert scale (1=rarely, 2=occasionally, 3=frequently, 4=often and 5=always) with the highest possible score of 100. Internet addiction is defined as a person scoring 43 points or above. This questionnaire was validated in Bahasa Malaysia by Chong Guan et al in 2012 and was named Malay Version Internet Addiction Test (MVIAT).<sup>4</sup> The (MVIAT) showed a good internal consistency (Cronbach's  $\alpha$  = 0.91, P< 0.001), parallel reliability (intra-class coefficient correlation= 0.88, P< 0.001) and concurrent validity with Compulsive Internet Use Scale (Pearson's correlation= 0.84, P< 0.00).

# 3.6.2 Objectives

- To identify the prevalence of internet use among adolescents in the past 30 days
- ii. To identify the prevalence of internet addiction among adolescents
- iii. To identify the type of devices used by internet users and addicts

### 3.6.3 Variable Definitions

- Internet Use: Internet access using any internet connecting devices for the past 30 days.
- Internet Addiction: Using a self-administered 20-item Malay Version Internet Addiction Test (MVIAT) questionnaire, respondents with a total score of 43 or above (all items answered) were defined as having internet addiction.

## 3.6.4 Findings

There were 1,626 secondary school students in Kelantan who responded to this module, of which 402 students were did not surf the internet for the past 30 days and 1204 students completed the MVIAT. The overall prevalence of internet use was 72.5% (95% CI: 63.93, 79.66) with an estimated projection to 87,934 school-going adolescents. In terms of school locality, students studying in urban areas (86.4%; 95% CI: 79.11, 91.44) had higher prevalence of internet use compared to students from rural areas (69.2%; 95% CI: 60.40, 76.73). There were 66.4% (95% CI: 56.18, 75.22) male students and 78.4% (95% CI: 71.17, 84.16) female students used internet in the past 30 days in Kelantan. Students in higher forms were more likely to use internet in the past 30 days (**Table 3.6.1**).

The prevalence of internet addiction among school-going adolescents in Kelantan was 17.4% (95% CI: 14.03, 21.45). In terms of school locality, there was no significant difference in internet addiction between students studying in urban areas (19.6%; 95% CI: 12.07, 30.26) and students from rural areas (16.9%; 95% CI: 13.33, 21.21). There were 16.2% (95% CI: 12.06, 21.42) male students and 18.6% (95% CI: 15.55, 22.10) female students with positive MVIAT. Form 5 students were observed as having the highest prevalence of

internet addiction in Kelantan (**Table 3.6.2**). Smartphone was the most prevalent device used by the internet users and addicts followed by the computer, laptop, or notebook group and tablet or iPad group (**Table 3.6.3 & Table 3.6.4**).

# 3.6.5 Discussion/ Conclusion

The prevalence of internet usage and internet addiction in Kelantan was significantly lower than the national prevalence as it is associated with the rate of internet penetration in Kelantan. Urban students and students in higher forms were observed as having higher prevalence of internet usage, however there was no significant difference in terms of sex of the respondents. No significant difference was observed in prevalence of internet addiction by school locality and sex of the respondents. However, students in higher forms were observed as having a higher prevalence of internet addiction. Most of the students used smartphones to surf the internet.

#### 3.6.6 Recommendations

- The internet addiction problems among Malaysian students is considered as new health risk behaviour that needs further in-depth understanding on internet accessibility, usage, difference in type of content viewed by age, gender and ethnicity, psychosocial factors and role of significant adult supervision, peers and environment to assist in designing specific strategies in prevention program.
- 2. As internet use and addiction increase with age, it is important that adolescents develop self-awareness on sign of internet addiction and develop self-control against excessive internet usage. It is proposed that the component of self-awareness and control against excessive internet usage is to be integrated into the 'Click Wisely Program' which was introduced by the Malaysian Communication Multimedia Commission (MCMC).
- 3. Parents should be made aware on dangers of excessive internet usage by secondary students and its detrimental effects on students' health and social development. It is proposed that development of health-related information on the internet addiction should be designed specifically for students and parents. To ensure wide

circulation of the messages, it is recommended that the Ministry of Health to collaborate with MCMC in disseminating the information through MCMC social network and Malaysian ICT volunteer (MIV) programs.

4. Smart partnerships with various agencies (governments, NGOs and private sectors) need to be enhanced to disseminate greater awareness on dangers of internet addiction and safe usage of internet to children, adolescents, parents, teachers and the community at large to assist in promotive, preventive and early intervention of internet addiction.

## 3.7 Mental Health Problems

Contributors: Noor Ani Ahmad, Muslimah Yusof, Mohamad Aznuddin Abd Razak, Noraida Mohamad Kasim, Fazly Azry Abdul Aziz, Rasidah Jamaluddin, Nurashikin Ibrahim.

## 3.7.1 Introduction

The World Health Organisation (WHO) estimates that one in five adolescents and children suffer from mental health problem and half of all mental illnesses begin by the age of 14. In Malaysia, the National Health and Morbidity Survey (NHMS) 2015 reported prevalence of mental health problems among 16 to 19 years old of 34.7%, while among 10-15 years the prevalence was 11.4%. In particular, WHO reported that suicide is the second leading cause of death among those youth. In 2011, NHMS observed that 2.4% of youth 16-24 years reported suicidal ideation.

# 3.7.2 Objectives

- i. To identify the prevalence of loneliness in the past 12 months
- ii. To identify the prevalence of inability to sleep due to worry in the past 12 months
- iii. To identify the prevalence of suicidal ideation in the past 12 months
- iv. To identify the prevalence of suicidal plan in the past 12 months
- v. To identify the prevalence of suicidal attempt in the past 12 months
- vi. To identify the prevalence of not having close friend

# 3.7.3 Variable definitions

- Lonely "most of the time or always": Responded either "most of the time" or "always" for felt lonely during past 12 months prior to the survey.
- Unable to sleep "most of the time or always" due to worry: Responded either
  "most of the time" or "always" for being worried about something that he/she could
  not sleep at night during past 12 months prior to the survey.
- **Suicidal ideation**: ever seriously considered attempting suicide in the past 12 months prior to the survey.

- Suicidal plan: made a plan of attempted suicide in the past 12 months prior to the survey.
- **Suicidal attempt**: attempted suicide at least once in the past 12 months prior to the survey.
- No close friend: Do not have any close friend

# 3.7.4 Findings

Overall, 7.0% (95%CI: 5.37, 9.07) of secondary school students in Kelantan reported that they felt lonely "most of the time or always" (Table 3.7.1). A total of 4.5% (95%CI: 3.18, 6.42) reported being unable to sleep "most of the time or always" due to worry (Table 3.7.2). In the past 12 months prior to the survey, suicidal ideation, plan and attempt, were reported by 6.4% (95%CI: 4.68. 8.71), 4.4% (95%CI: 3.36, 5.71), and 5.0% (95% CI: 2.99, 8.39) students, respectively (Table 3.7.3, Table 3.7.4 &Table 3.7.5). Suicidal ideation was observed as significantly higher in rural areas as compared to the urban areas (7.3% vs 2.6%). Table 3.7.6 showed that 2.8% (95%CI: 1.88, 4.10) of the students had no close friend.

## 3.7.5 Discussion/ Conclusion

The prevalence of being lonely among secondary school students in Kelantan reduced from 7.5% in Kelantan GSHS 2012<sup>5</sup> to 7.0% in this current survey. However, this survey noted increase prevalence of "inability to sleep due to worry" and "has no close friend" from only 3.9% and 2.2%, respectively in Kelantan GSHS 2012<sup>5</sup> to 4.5% and 2.8%, respectively. Furthermore, suicidal behaviours were observed as worsening compared to the prevalence in Kelantan GSHS 2012.<sup>5</sup> Suicidal ideation, plan and attempts increased from 4.6% to 6.4%, 3.8% to 4.4%, and 3.8% to 5.0%, respectively. However, the prevalence of suicidal behaviours in AHS 2017 was much lower than the national figures.

# 3.7.6 Recommendations

- Screening of at-risk students by School Health Teams and referral for further management
- 2. Holistic intervention programmes targeted to students at risk of suicide

3. Strengthen students coping skills and resilience through interactive health promotion activities

# 3.8 Physical Activity

Contributors: Lim Kuang Kuay, Mohd Azahadi Omar, Chan Ying Ying, Chandrika A/p Jeevananthan, Azli Baharudin @Shaharuddin, Nazirah Alias

## 3.8.1 Introduction

Physical inactivity is a public health problem worldwide and is the fourth leading cause of death worldwide.<sup>1</sup> It is an important contributor to major non-communicable diseases.<sup>2,3</sup> Sufficient physical activity has substantial health benefits for children and adolescents in terms of improving cardiovascular health<sup>4</sup>, mental health<sup>5</sup> and academic performance<sup>6</sup>. Despite these established benefits, a substantial proportion of young people fail to meet physical activity guidelines.

# 3.8.2 Objectives

- 1. To identify the prevalence of being physically active for a total of at least 60 minutes daily for five days or more in the past seven days,
- To identify the prevalence of spending at least three hours in sitting activities in a typical or usual day

## 3.8.3 Variable Definitions

- **Physical activity**: any activity that increases the heart rate and makes one breathe hard. Examples of physical activities include sports, playing with friends, walking to school, running, fast walking, biking or dancing.
- **Physically active:** physically active for at least 60 minutes per day, for a minimum of five days per week (sum of all the time spent in any kind of physical activity each day).

## 3.8.4 Findings

There were 1,626 secondary school students who responded to this module. The prevalence of being physically active for a total of at least 60 minutes daily for five days or more in the past seven days was 17.4% (95% CI: 15.60, 19.27), with an estimated projection to 121,228 school-going adolescents. In terms of school locality, it was significantly higher in urban

areas [23.5% (95% CI: 19.42, 28.13] compared to rural areas [15.9% (95% CI: 13.97, 18.01)]. By sex, the prevalence was significantly higher in males [22.2% (95% CI: 19.44, 25.18)] than in females [12.8% (95% CI: 10.61, 15.25)]. By form, Form 4 had the highest prevalence [21.2% (95% CI: 17.48, 25.39)], followed by Form 5 [20.9% (95% CI: 17.02, 25.37)] and Form 3 [16.6% (95% CI: 12.75, 21.40)] (Table 3.8.1).

Regarding sitting activities, the prevalence of spending at least three hours in a typical or usual day in sitting activities was 39.8% (95% CI: 37.43, 42.18). In terms of school locality, it was significantly higher in urban areas [52.2% (95% CI: 47.16, 57.24)] compared to rural areas [36.8% (95% CI: 34.17, 39.53)]. By sex, the prevalence was significantly higher among females [43.6% (95% CI: 40.21, 46.97)] than males [35.8% (95% CI: 32.57, 39.23)]. By form, Form 4 had the highest prevalence [46.7% (95% CI: 41.78, 51.60)], followed by Form 5 [44.7% (95% CI: 39.67, 49.92)] and Form 2 [42.1% (95% CI: 36.74, 47.57)] (Table 3.8.2).

## 3.8.5 Discussion/ Conclusion

The prevalence of s students being physically active for a total of at least 60 minutes daily for five days or more in the past seven days in Kelantan [17.3% (95% CI: 15.60, 19.27)] was lower than the national prevalence [19.8% (95% CI: 19.21, 20.40)] and the previous Kelantan GSHS 2012<sup>7</sup> [25.3% (95% CI: 19.71, 31.87)]. Male students and students who studying in urban areas were observed to be more physically active. However, there was no significant difference in terms of form. The prevalence of students who spent at least three hours in sitting activities in a typical or usual day [39.8% (95% CI: 37.43, 42.18)] was significantly lower than the national prevalence [50.1% (95% CI: 49.38, 50.85)] but higher than the previous Kelantan GSHS 2012<sup>7</sup> [38.2% (95% CI: 31.91, 44.96)). It was significantly higher in urban areas and male students. However, there was no significant difference in terms of form.

### 3.8.6 Recommendations

Schools represent an important setting for promoting physical activity as the adolescents spend approximately half of their waking day at school. Development of creative and

innovative "school-based interventions" such as engaging social media to promote healthy lifestyles particularly on increasing physical activity need to be explored.

## 3.9. Protective Factors

Contributors: Faizah Paiwai, S Maria Awaluddin, Nur Azna Mahmud, Noor Aliza Lodz, Norzawati Yoep

## 3.9.1 Introduction

According to Centre for Disease Control and Prevention (CDC), protective factors are individual or environmental characteristics, conditions, or behaviours that reduce the effects of stressful life events.<sup>1</sup> Important protective factors such as parental attachment and peer support especially for adolescence could influence their attitude and behaviour. Research has shown that adolescent attachment and relationships with parents and peers as well as schools they attend is a predictor of their psychological well-being.<sup>2</sup> Protective factor could help avoid unhealthy behaviours such as violence, sexual risk behaviours, tobacco use and drug abuse.<sup>3</sup> In order to measure the level of protective factors among school students, truancy is seen as an indicator, which is monitored by lower prevalence, as truancy often acts as the initial behaviour that can lead to other risky behaviour.<sup>4</sup>

# 3.9.2 Objectives

To identify prevalence of:

- i. Truancy in the past 30 days
- ii. Peer support in the past 30 days
- iii. Parental or guardian supervision in the past 30 days
- iv. Parental or guardian connectedness in the past 30 days
- v. Parental or guardian bonding in the past 30 days,
- vi. Parental or guardian respect for privacy in the past 30 days,

## 3.9.3 Variable Definitions

- Truancy: missed class or school without permission for at least one day in the past 30 days. (This variable is monitored with lower prevalence to define as protective factors)
- Peer support: students in their school were kind and helpful most of the time or always during the past 30 days.

- Parental or guardian supervision: parents or guardians had always or most of the time, checked to see if their homework was done in the past 30 days.
- Parental or guardian connectedness: parents or guardians had always or most of the time, understood their problems and worries in the past 30 days.
- Parental or guardian bonding: parents or guardians had always or most of the time,
   really knew what they were doing with their free time in the past 30 days.
- Parental or guardian respect for privacy: parents or guardians had never or rarely gone through their things without their approval in the past 30 days.

# 3.9.4 Findings

In Kelantan, the overall prevalence of truancy among students in the past 30 days was 30.8% (95% CI: 24.66, 37.67) of which in males were [33.9% (95% CI: 28.05, 40.24)] and females were [27.8% (95% CI: 20.83, 36.09)]. Prevalence of truancy according to form were [29.6% (95% CI: 22.31, 38.08), 34.1% (95% CI: 24.89, 44.76), 30.8% (95% CI: 22.21, 41.00), 29.2% (95% CI: 20.40, 39.97) and 30.1% (95% CI: 21.76, 40.11) from Form 1 to Form 5 respectively. In terms of school locality, prevalence of truancy in rural areas was [33.0% (95% CI: 27.37, 39.19) and urban areas was [21.4% (95% CI: 8.59, 44.22) (**Table 3.9.1**).

Overall prevalence of having peer support among students in Kelantan was 45.9% (95% CI: 39.14, 52.86); of which 34.8% (95% CI:27.88, 42.36) in males, 56.6% (95% CI:51.09, 62.00) in females (Table 3.9.2). Total prevalence of having parental or guardian supervision was 14.5% (95% CI:12.59, 16.62) which was 16.4% (95% CI: 14.49, 18.54) in males, 12.6% (95% CI: 10.23, 15.53) in females (Table 3.9.3). The overall prevalence of having parental or guardian connectedness was 33.5% (95% CI: 31.15, 35.86) of which 31.9% (95% CI: 26.99, 37.33) in males and 32.5% (95% CI: 37.43, 43.27) in females. In term of school locality, having parental or guardian connectedness was 37.7% (95% CI: 31.28, 44.52) in urban areas and 32.5% (95% CI: 30.42, 34.57) in rural areas (Table 3.9.4). Overall prevalence of having parental bonding was 40.4% (95% CI: 35.70, 45.32) which was 33.4% (95% CI: 29.25, 37.85) in males and 47.2% (95% CI: 41.80, 52.57) in females (Table 3.9.5). A total 75.2% (95% CI: 71.48, 78.64) of students reported having parental respect for privacy, 71.2% (95% CI: 67.16, 74.87) in males and 79.1% (95% CI: 74.12, 83.41) in females (Table 3.9.6).

# 3.9.5 Discussions/ Conclusion

Prevalence of truancy and protective factors (peer support, parental or guardian supervision, parental or guardian connectedness, parental or guardian bonding and parental or guardian respect for privacy) among students in Kelantan within the past 30 days shows no significant difference from the national prevalence. There were also no significant difference in the prevalence of truancy and protective factors reported between the national AHS 2017 and Kelantan GSHS 2012.<sup>5</sup>

#### 3.9.6 Recommendations

- 1. Monitoring attendance closely by participation of schools, parent and local organizations through enforcement of mandatory attendance law allows identification of at risk and truancy behaviour among school students.
- 2. Positive reinforcement which focuses on the positive points of behavior will encourage children to improve peer support, self-control and respect for others.
- 3. Establishment of school programs that need parent's supervision will help in improving the parenting skills especially in parental attachment.
- 4. Development of interventions that strengthen the protective factors among school students is important and more effective in reducing risk in order to improve the outcomes experienced by the students

# 3.10 Sexual Behaviours that contribute to HIV Infection, Other STIs and Unintended Pregnancy

Contributors: Maisarah Omar, Noor Aliza Lodz, Noraida Mohamad Kasim, S Maria Awaluddin, Noor Ani Ahmad, Nik Rubiah Nik Abdul Rashid

#### 3.10.1 Introduction

The WHO reported that 10% to 40% of young unmarried girls aged 13 to 19 years to have had an unintended pregnancy. It was also reported that the highest rate of Sexual Transmitted Illness (STI) worldwide are among young people aged 15 to 24 years. In Malaysia, Ministry of Health revealed that 12,492 teenage pregnancies were recorded in 2016. Therefore, sexual intercourse among school aged students is a public health concern in Malaysia due to the alarming numbers of the teenage unintended pregnancies and Sexual Transmitted Illness (STI) from this age group. Sexual 12,492

# 3.10.2 Objectives

To identify prevalence of:

- Current sexual intercourse in the past 30 days among Form 1 to Form 5 students in Malaysia.
- ii. Ever having sexual intercourse among Form 1 to Form 5 students in Malaysia.
- iii. First sexual experience before the age 14 years among those who ever had sex.
- iv. Having at least two sexual partners among those who ever had sex.
- v. Condom use during the last sexual intercourse among those who ever had sex.
- vi. Use of "other birth control methods" during the last sexual intercourse among those who ever had sex.

## 3.10.3 Variable Definitions

- **Sexual intercourse**: sexual acts of penetration of penis into vagina or anus.
- Safe sexual practice: sexual contact that doesn't involve the exchange of semen, vaginal fluids or blood between partners.

## 3.10.4 Findings

Prevalence of ever-had sex among Form 1 to Form 5 students in Kelantan was 7.0% (95% CI: 4.99, 9.85). Prevalence of ever-had sex among male students were 9.3% (95% CI: 5.91,14.36) while female students were at 4.9% (95% CI: 3.33, 7.10). Form 2 students showed the highest prevalence of 9.4% (95% CI: 4.69, 18.01) (**Table 3.10.1**). The prevalence of Form 1 to Form 5 students that were currently having sexual intercourse in Kelantan was 4.5% (95% CI: 3.27, 6.22). Form 3 students showed the highest prevalence of 5.9% (95% CI:2.33, 13.96) compared to other forms (**Table 3.10.2**).

Of those who ever-had sex, 36.7% (95% CI: 26.85, 47.80) of them had sex before the age of 14 years. Form 1 students showed the highest percentage at 60.8% (95% CI:31.95, 83.66) (Table 3.10.3). It was noted that 23.3% (95% CI: 14.04, 36.08) of those who were ever-had sex, had at least two sexual partners in which, male students were 26.6% (95% CI: 13.78, 45.20) and females were 17.3% (95% CI: 7.72, 34.34) (Table 3.10.4). Only 22.2% (95% CI: 13.74, 33.77) of those who ever-had sex used a condom during their last sexual intercourse while 14.9% (95% CI: 10.72, 20.40) used other birth control methods (Table 3.10.5 & Table 3.10.6).

## 3.10.5 Discussion/ Conclusion

The prevalence of ever-had sexual intercourse in Kelantan AHS 2017 (7.0%) did not differ with the national prevalence in 2017 (7.3%), however the prevalence was higher than the previous Kelantan GSHS in  $2012^4$  (5.7%).

## 3.10.6 Recommendations

- 1. To strengthen sexual health education especially among students and to educate them regarding the complications of unsafe sex.
- 2. To conduct more studies especially qualitative studies in exploring the sexual orientation of the students, abortion and unintended pregnancy.
- To strengthen and actively provide services of our adolescent health screening (BSSK) in schools.

#### 3.11 Tobacco Use

Contributors: Muhammad Fadhli Bin Mohd Yusoff, Jane Ling Miaw Yn, Tee Guat Hiong, Noraryana Binti Hassan, Nizam Bin Baharom, Wan Shakira Rodzlan Hasani, Tania Gayle Robert, Halizah Mat Rifin, Hamizatul Akmal Abd Hamid, Abdul Aiman Abd Ghani, Hasimah Ismail, Thamil Arasu Saminathan, Nur Liana Ab. Majid.

#### 3.11.1 Introduction

Most smokers experimented and started smoking during their school aged days. For example, in Malaysian Global Adults Tobacco Survey (GATS) 2011, 51.8% of the smokers started smoking daily before the age of 18.1 Therefore, monitoring tobacco use among Malaysian adolescents is an important process in tobacco control. Malaysia is committed with the implementation of the WHO Framework Convention on Tobacco Control to achieve targeted lower smoking prevalence and creating smokefree Malaysian generations.

## 3.11.2 Objectives

To identify the prevalence of:

- i. Current smokers
- ii. Current cigarette smokers
- iii. Current E-cigarette/vape users
- iv. Current any tobacco product users
- v. Current smoke and smokeless tobacco product use by types
- vi. Having tried a cigarette before the age of 14 years, among ever cigarette smokers
- vii. Having tried E-cigarettes or vape before the age of 14 years, among ever E-cigarette or vape users
- viii. Quit smoking attempt in the past 12 months among those who ever smoked cigarettes
  - ix. Quit E-cigarettes or vape attempt in the past 12 months among those who ever used E-cigarettes or vape
  - x. Having been exposed to people smoking in their presence for at least one day in the past seven days

- xi. Having parents or guardians who used any form of tobacco products
- xii. Having parents or guardians who used E-cigarettes or vape

#### 3.11.3 Variable Definitions

- Current smoker: Used any smoked tobacco products in the past 30 days (Manufactured cigarette, Roll-your-own cigarette, Traditional hand-rolled cigarette, Shisha, Cigar, or Pipe).
- **Current cigarette smoker**: smoked manufactured cigarette, rolled-your-own, or traditional hand roll cigarette in the past 30 days.
- Current E-cigarette/Vape user: Used E-cigarette/Vape in the past 30 days.
- Current any tobacco product user: Used any tobacco products in the past 30 days (Manufactured cigarette, Roll-your-own cigarette, Traditional hand-rolled cigarette, Shisha, Cigar, and Pipe, E-cigarette/Vape, Chewing tobacco or Snuff)

### 3.11.4 Findings

The prevalence of current smokers was 20.4% (95% CI: 15.51, 26.27) **(Table 3.11.1)**. The prevalence was significantly higher among males (34.3%; 95% CI: 28.17, 41.08) as compared to females (7.0%; 95% CI 4.85, 9.87). Form 3 students had the highest prevalence of 24.2% (95% CI: 16.03, 34.86) with no significant difference across all forms.

The prevalence of current cigarettes smokers was 16.5% (95% CI: 12.41, 21.64) (Table 3.11.2). The prevalence was significantly higher in males (28.1%; 95% CI: 22.44, 34.56) than females (5.4%; 95% CI: 3.79, 7.61). Form 3 students reported highest prevalence (20.9%; 95% CI 13.68, 30.52) but no significant difference compared to the other forms. Among those who ever smoked cigarettes, 67.6% (95%CI: 53.27, 79.21) had first tried a cigarette before the age of 14 years, with no significant difference by gender (Table 3.11.6).

Overall, 26.7% (95% CI: 22.32, 31.59) currently use any tobacco products **(Table 3.11.3).** Males (43.2%; 95% CI: 38.21, 48.39) had significantly higher prevalence compared to females (10.8%; 95% CI: 8.23, 14.11). Form 3 students reported highest prevalence (31.1%; 95% CI 23.26, 40.09) compared to the other forms.

The prevalence of using shisha/hookah in the past 30 days was 10.6% (95% CI: 7.70, 14.47) (Table 3.11.5). Males (17.8%; 95% CI: 13.87, 22.54) had significantly higher prevalence compared to females (3.8%; 95% CI: 2.26, 6.18). The prevalence of traditional rolled cigarette use was 9.5% (95% CI: 6.86, 12.88) (Table 3.11.5). Males (15.2%; 95% CI: 10.57, 21.41) had significantly higher prevalence compared to females (3.9%; 95% CI: 2.66, 5.79). The prevalence of rolled your own was 3.2% (95% CI: 1.81, 5.47) with no significant difference across gender (Table 3.11.5). 3.5% (95% CI: 2.22, 5.49) of the students used cigar (Table 3.11.5). Males (5.5%; 95% CI: 3.16, 9.41) had significantly higher prevalence compared to females (1.6%; 95% CI: 0.98, 2.59). The prevalence of using pipe was 3.1% (95% CI: 1.94, 4.92) with no significant difference across gender (Table 3.11.5).

Among those who smoked cigarettes in the past 12 months, 71.8% (95% CI: 61.66, 80.11) had tried to stop smoking (**Table 3.11.8**). Males (78.8%; 95% CI: 69.41, 85.87) had significantly higher prevalence compared to females (24.5%; 95% CI: 11.01, 46.01). Form 5 students had the highest prevalence (84.8%; 95% CI 69.08, 93.34) compared to the other forms.

A total of 46.6% (95% CI: 41.85, 51.44) reported having been exposed to people who smoked in their presence in the past 7 days (**Table 3.11.10**). Males (57.8%; 95% CI: 50.93, 64.32) had significantly higher prevalence compared to females (35.9%; 95% CI: 30.77, 41.35). Form 5 students reported highest prevalence (55.5%; 95% CI 47.69, 63.11) compared to other forms.

Overall, 51.6% (95% CI: 47.93, 55.29) of students reported having parents or guardian who used any form of tobacco products with no significant difference across gender **(Table 3.11.11)**. Form 1 students had the highest prevalence (56.8%; 95% CI 50.54, 62.93) compared to other forms.

The prevalence of current E-cigarette use was 11.5% (95% CI: 8.61, 15.15) (Table 3.11.4). Males reported significantly higher prevalence 21.0% (95% CI: 17.40, 25.23) compared to females 2.3% (95% CI: 1.28, 4.03). Form 3 students had the highest prevalence (14.8%; 95% CI 8.06, 25.63) compared to the other forms. Among those who ever smoked e-cigarette/vape, 35.4% (95%CI: 26.06, 46.03) had first tried e-cigarette/vape before the age of 14 years, with no significant difference by gender (Table 3.11.7).

Among those who used e-cigarette/vape in the past 12 months, 58.4% (95% CI: 47.16, 68.91) had tried to stop using e-cigarette/vape (**Table 3.11.9**). There was no significant difference across gender. Form 4 students had the highest prevalence (69.4%; 95% CI 56.77, 79.69) compared to other forms.

Overall, 16.1% (95% CI: 12.63, 20.33) of students reported having parents or guardian who used e-cigarette/vape with no significant difference across gender (Table 3.11.12). Form 2 students had the highest prevalence (19.0%; 95% CI 12.36, 28.14) compared to other form.

The prevalence of chewing tobacco was 2.6% (95% CI: 1.31, 4.92) with no significant difference across gender (**Table 3.11.5**). The prevalence of snuff use was 7.7% (95% CI: 5.66, 10.35) with no significant difference across gender (**Table 3.11.5**).

## 3.11.5 Discussion/Conclusion

The prevalence of cigarette smoking in Kelantan was not significantly different compared to the national prevalence. Similarly, the prevalence of having tried a cigarette before the age of 14 among ever cigarette smokers and the prevalence of having been exposed to people who smoke in their presence in the past seven days showed no significant difference compared to the national prevalence.

### 3.11.6 Recommendations

All screening, prevention and intervention programmes among adolescents must be strengthened and delivered in synergy by all governmental and non-governmental agencies. Interventions should also be targeted to higher risk groups such as states with high prevalence, males and Form 1 students. The rise of prevalence of smoking among females should also be a concern for additional interventions to halt this increment. Overall national tobacco control programmes have to be amplified to achieve denormalization of public smoking, and to help reduce exposure to cigarette smoke among our youth. These would help to achieve the medium and long-term targets as stipulated in the National Strategic Plan for Tobacco Control.

## 3.12 Violence and Unintentional Injury

Contributors: Rajini Sooryanarayana, Shubash Shander Ganapathy, Azriman Rosman, Mohd Hazrin Bin Hasim@Hashim, Fazila Haryati Ahmad, Mohamad Fuad Mohamad Anuar, Tan Lee Ann, Thamil Arasu a/I Saminathan, Muhammad Fadhli Mohd Yusoff, S Maria Awaluddin

#### 3.12.1 Introduction

The World Health Assembly through WHA 49.25 had declared violence to be a public health problem globally. Malaysia is committed towards resolving this issue, covering various aspects of interpersonal violence.<sup>1</sup> The prevalence of bullying varies between 9% to 25% in school-going adolescents in Western countries<sup>2</sup>, and 10.8% to 17.6% locally<sup>3</sup>, differences largely explained by linguistic and cultural factors.

Injuries are inevitable among anyone, including adolescents. Injuries however, may be due to intentional or unintentional causes. Unintentional injuries are caused by various factors and this leads to health problems and disability in an otherwise healthy population. Conflicts happen due to a wide spectrum ranging from physical fights to bullying. These may affect the mental health, well-being and healthy development of the adolescent.

This survey aims to examine the prevalence and distribution of unintentional injuries, physical attacks, physical fights, bullying, as well as physical and verbal abuse experienced by adolescents in Form 1 to Form 5 in Malaysia.

### 3.12.2 Objectives

To describe the prevalence of:

- i. Having been physically attacked at least once in the past 12 months
- ii. Involvement in a physical fight at least once in the past 12 months
- iii. Having been bullied at least once in the past 30 days
- iv. Physical abuse at home at least once in the past 30 days
- v. Verbal abuse at home at least once in the past 30 days
- vi. Having had a serious injury at least once in the past 12 months

#### 3.12.3 Variable Definitions

- Physical attack: when one or more persons hurt another person with or without a
  weapon such as sticks or knives in the past 12 months. It is NOT a physical attack when
  two individuals or students of about the same strength or power choose to fight each
  other.
- Physical fight: when two individuals or students of about the same strength or power choose to fight each other in the past 12 months.
- Bullying: when a student or group of students say or do bad and unpleasant things to
  another student, such as teasing a lot in an unpleasant way or leaving out of things on
  purpose in the past 30 days. It is NOT bullying when two students of about the same
  strength or power argue or fight or when teasing is done in a friendly and fun way.
- **Physical abuse at home:** when someone is hit so hard that it left a mark OR caused an injury in the past 30 days
- **Verbal abuse at home:** when someone has had hurtful or insulting things said to them in the past 30 days
- Unintentional injury: a serious injury which makes the student miss at least one full
  day of usual activity (such as school, sports or a job) OR requires treatment by a doctor
  or a medical personnel in the past 12 months

# 3.12.4 Findings

Among the adolescents, 21.8% (95% CI: 18.47, 25.55) of them had been physically attacked, which was higher in males [26.2% (95% CI: 21.36, 31.72)] compared to females [17.6% (95% CI: 13.43, 22.63)]. There was no significant difference found between urban [20.3% (95% CI: 16.11, 25.30) and rural [22.2% (95% CI: 18.24, 26.64)] localities. Adolescents from Form 1 had the highest prevalence of being physically attacked; 28.8% (95% CI: 21.29, 37.80) while adolescents from Form 5 had the lowest prevalence at 15.6% (95% CI: 11.77, 20.47) (Table 3.12.1).

Similarly, 21.2% (95% CI: 15.70, 28.03) of adolescents claimed to have been involved in physical fight(s), with more males [26.2% (95% CI: 20.55, 32.79)] than females [16.4% (95% CI: 10.60, 24.56] involved. There was no significant difference between urban and rural localities, with a reported prevalence of 16.5% (95% CI: 10.35, 25.38) and 22.3% (95% CI: 15.96, 30.34) respectively. Adolescents from Form 1 had the highest prevalence at 29.5% (95% CI: 20.87, 39.80) (Table 3.12.1).

With regards to bullying, 12.5% (95% CI: 9.79, 15.73) of adolescents reported to have been bullied and this was higher among males [14.1% (95% CI: 11.16, 17.74)] compared to females [10.9% (95% CI: 7.76, 14.98)]. There was no significant difference found between urban [9.2% (95% CI: 8.77, 9.58)] and rural [13.2% (95% CI: 10.14, 17.12)] localities. Adolescents from Form 1 had the highest prevalence of have been bullied; 18.2% (95% CI: 10.36, 29.86) (Table 3.12.2).

The two most common forms of bullying were 'being made fun of because of how body or face looks' [15.0% (95% CI: 9.42, 22.95)] and 'being made fun of race, nationality or colour' [14.6% (95% CI: 10.02, 20.79)]. Bullying in the form of 'being hit, kicked, shoved around or locked indoor' was the least common at 3.0% (95% CI: 1.08, 8.09) (Table 3.12.3).

Physical abuse at home was reported by 8.8% (95% CI: 5.55, 13.55) of the adolescents. Urban localities reported a prevalence of 5.5% (95% CI: 2.63, 11.19) with rural at 9.5% (95% CI: 5.79, 15.30). There was no significant difference between males and females with a prevalence of

9.1% (95% CI: 4.92, 16.28) and 8.4% (95% CI: 5.80, 12.03) respectively. Form 5 adolescents reported the lowest prevalence at 3.6% (95% CI: 1.84, 7.08) (Table 3.12.4).

It was reported that 42.1% (95% CI: 37.54, 46.78) of adolescents were abused verbally at home. The prevalence of verbal abuse was significantly higher among females [49.7% (95% CI: 43.14, 56.31)] compared to males [34.1% (95% CI: 30.26, 38.25)]. There was no significant difference found between urban [42.2% (95% CI: 36.94, 47.66)] and rural [42.1% (95% CI: 36.59, 47.73)] localities. Adolescents from Form 5 had the lowest prevalence of verbal abuse at home with a prevalence of 40.0% (95% CI: 33.32, 47.08) (Table 3.12.4).

It was found that 30.9% of adolescents in Kelantan (95% CI: 24.60, 37.98) had been seriously injured in the past 12 months. There was no significant difference found between urban [26.7% (95% CI: 19.63, 35.16)] and rural [31.9% (95% CI: 24.53, 40.29)] localities. Prevalence of serious injury was significantly higher among males [38.5% (95% CI: 31.66, 45.92)] as compared to females [23.5% (95% CI: 18.10, 30.00)]. Adolescents from Form 1 had the highest prevalence of serious injury at 38.3% (95% CI: 28.63, 49.06) while adolescents from Form 5 had the lowest prevalence at 26.0% (95% CI: 18.43, 35.38) (Table 3.12.5).

Among those who had been seriously injured, the two most common injuries were 'a cut or stab wound' [22.8% (95% CI: 18.46, 27.81)] and 'a broken bone/dislocated joint' [10.7% (95% CI: 7.22, 15.66)] (Table 3.12.6). The two most common causes of serious injury were falls [32.5% (95% CI: 27.33, 38.22) and motor vehicle accidents [17.2% (95% CI: 12.46, 23.27)] (Table 3.12.7).

## 3.12.5 Discussion/ Conclusion

The prevalence of serious injury among school-going adolescents in Kelantan was higher than the national prevalence found in this study (30.9% vs. 29.9%) but lower than that reported in Kelantan GSHS 2012<sup>4</sup> (32.7%). The prevalence of being physically attacked and those involved in physical fights were lower among adolescents in Kelantan than the national prevalence (21.8% vs 25.3% and 21.2% vs 24.9% respectively) as well as that reported in Kelantan GSHS 2012<sup>4</sup> (24.1% 23.6% respectively).

The prevalence of bullying among school going adolescents in Kelantan was lower than the reported national prevalence (12.5% vs 16.2%) and that reported in Kelantan GSHS 2012<sup>4</sup> (12.7%). The prevalence of physical abuse and verbal abuse at home among adolescents were lower in Kelantan compared to national prevalence (8.8% vs 11.8% and 42.1% vs 43.2% respectively). Physical abuse in Kelantan GSHS 2012<sup>4</sup> was reportedly lower at 7.6%, as was verbal abuse at 39.9%.

Studies have shown that violence related behaviour is associated with other negative factors such as smoking, drug abuse, truancy and physical and mental health problems<sup>5</sup>. Thus, despite the successes achieved by our current programs, the relatively high prevalence found in this study reminds us that we should continue our efforts in addressing this issue.

#### 3.12.6 Recommendations

- 1. Multiple factors are associated with the perpetuation and the victimization of bullying, violent behaviour and unintentional injuries among school-going adolescents. Although this study identified the prevalence and types of violent behaviour experienced, further studies may be conducted in these areas to better understand this problem. These should include risk factors such as health and sociocultural factors, help seeking behaviour and short and long term effects of engaging or being exposed to these situations.
- 2. Written policies and laws by themselves alone are not adequate to tackle the problem of physical attacks, physical fights, bullying, physical and verbal abuse experienced by school-going adolescents. Strategies should be developed with the involvement of parents, family, and the community. Support services for both perpetrator and victim at community and school levels should be developed. Increased efforts need to be directed towards male adolescents in the younger age group and within the Indian community. Helping them with counselling rather than punitive measures, besides early detection of underlying factors would aid better prevention strategies. Innovative measures including use of social media, need to be adapted in line with the problems faced by the current generation such as cyberbullying and online forms of

abuse. An integrated, multifactorial and multisectoral approach from the family level to school environment is crucial in addressing this problem.

3. Unintentional injuries should be addressed by stepping up safety awareness programs. This should be targeted towards road and traffic safety, starting from the younger age group. This would help reduce the burden of avoidable and unintentional injuries. Measures to create a safe environment within the school, home and other areas should be implemented by all parties.

# TINJAUAN KESIHATAN REMAJA ADOLESCENT HEALTH SURVEY NHMS 2017

#### **PENGENALAN**

Kementerian Kesihatan Malaysia dengan kerjasama Kementerian Pendidikan Malaysia sedang menjalankan tinjauan yang berkaitan kesihatan remaja. Tinjauan ini adalah berkenaan dengan kesihatan anda dan tindakan yang anda ambil yang memberi kesan kepada kesihatan anda.

Terima kasih kerana bersetuju untuk menyertai tinjauan ini. Tiada jawapan yang **BETUL** atau **SALAH**. Markah peperiksaan anda tidak akan terjejas sekiranya anda menjawab atau tidak menjawab soalan dalam tinjauan ini. Setiap jawapan yang anda berikan boleh membantu memantapkan program kesihatan untuk remaja. Oleh itu, sila jawab dengan ikhlas dan tepat.

Segala maklumat individu yang diberikan adalah RAHSIA kerana TIADA MAKLUMAT PENGENALAN DIRI DIAMBIL dan TIDAK AKAN DIDEDAHKAN. Tiada siapa akan tahu jawapan anda. Sila jawab berdasarkan apa yang anda tahu.

### **INTRODUCTION**

The Ministry of Health Malaysia, with the cooperation of the Ministry of Education Malaysia is conducting a survey on adolescent health. This survey is about your health and the things that you do that may affect your health.

Thank you for agreeing to participate in this survey. There are no **CORRECT** or **WRONG** answers. None of your grades or marks will be affected whether or not you answer the questions. Each answer that you provide will help in the improvisation of health programs for adolescents. Therefore, please answer as honestly and accurately as possible.

All individual information given will be kept SECRET because NO INDENTIFIERS ARE TAKEN nor WILL BE EXPOSED. No one will know your answer. Answer the questions based on the best of your knowledge.

## PANDUAN MENGISI BORANG (SILA BACA DENGAN TELITI)

GUIDE ON FILLING THE QUESTIONNAIRE (PLEASE READ CAREFULLY)

a. **JANGAN** tulis **NAMA ANDA** pada kertas soalan mahupun kertas jawapan.

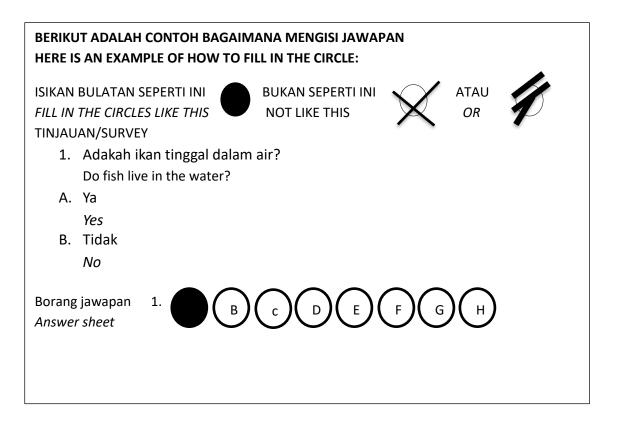

**DO NOT** write **YOUR NAME** on the questionnaire or the answer sheet.

b. Sila **BACA PERNYATAAN** untuk soalan yang memberikan pernyataan atau definisi sebelum menjawab soalan.

Please **READ STATEMENT** for questions with a preceding statement or definition before answering.

c. Sila **HITAMKAN** jawapan yang bersamaan jawapan anda pada kertas jawapan yang disediakan. Hanya hitamkan **SATU JAWAPAN** bagi setiap soalan. Sila gunakan pensel 2B yang disediakan. Sekiranya telah selesai, ikut arahan pegawai yang melakukan survei di sekolah/kelas anda.

Please FILL IN THE CIRCLES on your answer sheet that matches your answer. There can be **ONLY ONE ANSWER** for each question. Use only the provided 2B pencil . When you are done, follow the instructions of the person conducting the survey in your school/class

# BAHAGIAN 1 PART 1

- Berapakah umur anda? How old are you?
  - a. 11 tahun atau ke bawah11 years old or younger
  - b. 12 tahun
    - 12 years old
  - c. 13 tahun
    - 13 years old
  - d. 14 tahun
    - 14 years old
  - e. 15 tahun
  - e. 15 tantun
    - 15 years old
  - f. 16 tahun
    - 16 years old
  - g. 17 tahun
    - 17 years old
  - h. 18 tahun atau ke atas
    - 18 years old or older
- 2. Apakah jantina anda? What is your sex?
  - a. Lelaki *Male*
  - b. Perempuan Female
- 3. Anda belajar di tingkatan/kelas apa? *In what form/class are you?* 
  - a. Kelas peralihan Remove class
  - b. Tingkatan 1 Form 1
  - c. Tingkatan 2
  - d. Tingkatan 3
    Form 3
  - e. Tingkatan 4 Form 4
  - f. Tingkatan 5 Form 5

- 4. Apakah etnik anda? What is your ethnicity?
  - a. Melayu *Malay*
  - b. Cina Chinese
  - c. India
  - Indian d. Bumiputera Sabah
  - Bumiputera Sabahe. Bumiputera SarawakBumiputera Sarawak
  - f. Lain-lain etnik

    Some other ethnic
- 5. Apakah status perkahwinan ibu bapa anda?

What is the marital status of your parents?

- a. Berkahwin dan tinggal bersama Married and living together
- Berkahwin tetapi tidak tinggal bersama atas dasar bekerja di tempat lain Married but living apart due to working in other place
- c. Bercerai Divorced

   Widower (my mother or father has died)
- e. Berpisah (ibu bapa tidak tinggal serumah)
  Separated (my parent do not live
- together)
  f. Tidak tahu
  I do not know

#### BAHAGIAN 2 PART 2

6. Dalam tempoh 30 hari yang lepas, berapa kerap anda kelaparan kerana tidak cukup makanan di rumah?

During the past 30 days, how often did you go hungry because there was not enough food in your home?

- a. Tidak pernah Never
- b. Jarang-jarang
- Rarely
  c. Kadang-kadang
  Sometimes
- d. Kebanyakan masa Most of the time
- e. Sentiasa Alwavs

Enam soalan yang berikutnya adalah berkenaan apa yang anda mungkin makan atau minum.

The next six questions ask about what you might eat and drink.

7. Dalam tempoh 30 hari yang lepas, berapa kali dalam sehari anda **biasanya** makan buah?

During the past 30 days, how many times per day did you **usually** eat fruits?

- Saya tidak makan buah dalam 30 hari yang lepas
  - I did not eat fruits during the past 30 days
- b. Kurang dari 1 kali sehari Less than 1 time per day
- c. 1 kali sehari
  1 time per day
- d. 2 kali sehari
  - 2 times per day
- e. 3 kali sehari
  3 times per day
- f. 4 kali sehari
  - 4 times per day
- g. 5 kali atau lebih sehari5 or more times per day

8. Dalam tempoh 30 hari yang lepas, berapa kali dalam sehari anda **biasanya** makan sayur?

During the past 30 days, how many times per day did you **usually** eat vegetables?

- Saya tidak makan sayur dalam 30 hari yang lepas
  - I did not eat vegetables during the past 30 days
- b. Kurang dari 1 kali sehari Less than 1 time per day
- c. 1 kali sehari
  1 time per day
- d. 2 kali sehari
- 2 times per daye. 3 kali sehari
  - 3 times per day
- f. 4 kali sehari
  4 times per dav
- g. 5 kali atau lebih sehari5 or more times per day
- 9. Dalam tempoh 30 hari yang lepas, berapa kali dalam sehari anda biasanya minum air berkarbonat seperti Coca Cola, Sprite, Pepsi dan lain-lain? (Air berkarbonat diet tidak termasuk dalam kumpulan ini)

  During the past 30 days, how many times per day did you usually drink carbonated soft drinks such as Coca Cola, Sprite, and Pepsi? (Do not include diet soft drinks)
  - a. Saya tidak minum air berkarbonat dalam 30 hari yang lepas
     I did not drink carbonated soft drink during the past 30 days
  - b. Kurang dari 1 kali sehariLess than 1 time per day
  - c. 1 kali sehari
    1 time per day
  - d. 2 kali sehari
    - 2 times per day
  - e. 3 kali sehari
    - 3 times per day
  - f. 4 kali sehari
    - 4 times per day
  - g. 5 kali atau lebih sehari5 or more times per day

10. Dalam tempoh 30 hari yang lepas, berapa kali dalam sehari anda biasanya minum air kosong seperti air mineral, air masak atau air paip?

During the past 30 days, how many times per day did you **usually** drink plain water such as mineral water, boiled water, or tap water?

- Saya tidak minum air kosong dalam 30 hari yang lepas
  - I did not drink plain water during the past 30 days
- b. Kurang dari 1 kali sehari Less than 1 time per day
- c. 1 kali sehari
  1 time per day
- d. 2 kali sehari
- 2 times per day e. 3 kali sehari
- e. 3 kall senari 3 times per day
- f. 4 kali sehari
  4 times per day
- g. 5 kali atau lebih sehari5 or more times per day
- 11. Dalam tempoh 30 hari yang lepas, berapa kali dalam sehari anda biasanya minum susu atau makan produk tenusu seperti susu, keju, yogurt dan lain-lain? (Ini tidak termasuk susu pekat manis) During the past 30 days, how many times per day did you usually drink milk or eat milk products, such as milk, cheese, and yogurt? (This does not include sweetened condensed milk)
  - Saya tidak minum susu atau makan produk tenusu dalam 30 hari yang lepas

- I did not drink milk or eat milks products during the past 30 days
- Kurang dari 1 kali sehari
   Less than 1 time per day
- c. 1 kali sehari
  1 time per day
- d. 2 kali sehari
  - 2 times per day
- e. 3 kali sehari
  - 3 times per day
- f. 4 kali sehari
  - 4 times per day
- g. 5 kali atau lebih sehari5 or more times per day
- 12. Dalam tempoh 7 hari yang lepas, berapa hari anda makan makanan segera dari restoran **makanan segera** seperti McDonald, KFC, dan Pizza Hut?

  During the past 7 days, how many days did you eat food from a **fast food** restaurant, such as McDonalds, KFC and Pizza Hut?
  - a. 0 hari
    - 0 day
  - b. 1 hari
    - 1 day
  - c. 2 hari
  - 2 days
  - l. 3 hari
  - 3 days
  - e. 4 hari
    - *4 day*s 5 hari
    - *5* ./. .
  - 5 days g. 6 hari
    - 6 days
  - h. 7 hari
    - 7 days

### BAHAGIAN 3 PART 3

6 soalan seterusnya adalah berkenaan amalan pembersihan gigi, lawatan pergigian anda dan juga bagaimana gigi anda memberi kesan kepada aktiviti-aktiviti anda.

The 6 next question are about the cleaning of your teeth, your dental visits and also how your teeth affect your activities.

13. Dalam tempoh 30 hari yang lepas, berapa kali dalam sehari anda membersih atau memberus gigi anda?

During the past 30 days, how many times per day did you usually clean or brush your teeth?

- a. Saya tidak membersih atau memberus gigi dalam 30 hari yang lepas
   I did not clean or brush my teeth during the past 30 days
- b. Kurang dari 1 kali sehari Less than 1 time per day
- c. 1 kali sehari

  1 time per day
- d. 2 kali sehari
  - 2 times per day
- e. 3 kali sehari
  - 3 times per day
- f. 4 kali atau lebih dalam sehari 4 or more times per day
- 14. Adakah anda menggunakan ubat gigi berflourida?

Do you use toothpaste that contain fluoride?

a. Ya

Yes

b. Tidak

No

c. Tidak tahu

I do not know

15. Adakah anda menggunakan flos/benang gigi untuk membersih gigi anda?

Do you use dental floss to clean your teeth?

a. Ya

Yes

b. Tidak

No

16. Bilakah kali terakhir anda berjumpa doktor gigi atau jururawat pergigian untuk pemeriksaan, pembersihan gigi atau rawatan pergigian yang lain?

When was the last time you saw a dentist or dental nurse for a check-up, teeth cleaning, or other dental treatment?

- a. Dalam tempoh 12 bulan yang lepas During the past 12 months
- b. Di antara 12 hingga 24 bulan yang lepas

Between 12 and 24 months ago

- c. Lebih daripada 24 bulan yang lepas More than 24 months ago
- d. Tidak pernah Never
- e. Tidak tahu

  I do not know
- 17. Dalam tempoh 12 bulan yang lepas, adakah sakit gigi menyebabkan anda tidak hadir ke kelas atau sekolah?

During the past 12 months, did a toothache cause you to miss classes or school?

a. Ya

Yes

b. Tidak

No

18. Adakah anda mengelak untuk senyum atau ketawa kerana risau dengan rupa gigi anda?

Do you avoid smiling or laughing because how your teeth look?

a. Ya

Yes

b. Tidak

No

During the past 12 months, how many times were you physically attacked?

- a. 0 kali
  - 0 times
- b. 1 kali
  - 1 time
- c. 2 atau 3 kali
  - 2 or 3 times
- d. 4 atau 5 kali
- 4 or 5 times e. 6 atau 7 kali
- 6 or 7 times
- f. 8 atau 9 kali
- i. O alau 3 kali
  - 8 or 9 times
- g. 10 atau 11 kali
  - 10 or 11 times
- h. 12 kali atau lebih
  - 12 or more times

#### SILA BACA PERNYATAAN DI BAWAH:

Soalan seterusnya adalah berkaitan pergaduhan fizikal. Pergaduhan fizikal berlaku apabila dua individu atau pelajar yang sama saiz atau kekuatan bersetuju untuk bergaduh secara fizikal.

PLEASE READ THE STATEMENT BELOW: The next question asks about physical fights. A physical fight occurs when two individuals or students of about the same strength or power choose to fight each other.

23. Dalam tempoh 12 bulan yang lepas, berapa kali anda terlibat dalam pergaduhan secara fizikal?

During the past 12 months, how many times were you in physical fight?

- a. 0 kali
  - 0 times
- b. 1 kali
  - 1 time
- c. 2 atau 3 kali
  - 2 or 3 times
- d. 4 atau 5 kali
  - 4 or 5 times
- e. 6 atau 7 kali
  - 6 or 7 times
- f. 8 atau 9 kali
  - 8 or 9 times
- g. 10 atau 11 kali
  - 10 or 11 times
- h. 12 kali atau lebih
  - 12 or more times

#### SILA BACA PERNYATAAN DI BAWAH:

3 soalan seterusnya adalah berkenaan kecederaan serius yang pernah anda alami. Kecederaan serius berlaku apabila anda tidak hadir <u>sekurang-kurangnya satu hari</u> aktiviti yang biasa dilakukan (termasuk sekolah, sukan atau kerja) atau kecederaan yang memerlukan rawatan daripada doktor atau anggota kesihatan.

47. Berapakah umur anda ketika kali pertama anda minum minuman beralkohol?

How old were you when you had your first drink of alcohol?

 Saya tidak pernah minum minuman beralkohol

I have never had a drink of alcohol

b. 7 tahun atau ke bawah 7 years old or younger

c. 8 atau 9 tahun 8 or 9 years old

d. 10 atau 11 tahun 10 or 11 years old

e. 12 atau 13 tahun 12 or 13 years old

f. 14 atau 15 tahun 14 or 15 years old

g. 16 tahun atau ke atas 16 years old or older

48. Dalam tempoh 30 hari yang lepas, berapa hari anda mengambil sekurang-kurangnya satu minuman mengandungi alkohol?

During the past 30 days, on how many days did you have at least one drink containing alcohol?

a. 0 hari 0 days

b. 1 atau 2 hari

1 or 2 days

c. 3 hingga 5 hari 3 to 5 days

d. 6 hingga 9 hari 6 to 9 days

e. 10 hingga 19 hari 10 to 19 days

f. 20 hingga 29 hari 20 to 29 days

g. Kesemua 30 hari All 30 days 49. Dalam tempoh 30 hari yang lepas, pada hari anda minum minuman alkohol; berapa banyak minuman yang anda **biasa** ambil **dalam sehari**?

During the past 30 days, on the day you drank alcohol, how many drinks did you usually drink per day?

- a. Saya tidak minum minuman beralkohol dalam 30 hari yang lepas
   I did not drink alcohol during the past 30 days
- b. Kurang dari 1 minuman Less than one drink
- c. 1 minuman
  - 1 drink
- d. 2 minuman
  - 2 drinks
- e. 3 minuman
  - 3 drinks
- f. 4 minuman
  - 4 drinks
- g. 5 minuman atau lebih
  - 5 or more drinks
- 50. Dalam tempoh 30 hari yang lepas, biasanya bagaimana anda mendapatkan minuman beralkohol ? SILA PILIH SATU JAWAPAN SAHAJA

During the past 30 days, how did you usually get the alcohol you drank? **SELECT ONLY ONE RESPONSE** 

- a. Saya tidak minum minuman beralkohol dalam 30 hari yang lepas
   I did not drink alcohol during the past 30 days
- Saya beli dari kedai atau gerai
   I brought it in a store, shop or from a street vendor
- c. Saya beri duit kepada orang lain untuk membeli
  - I gave someone else money to but it for me
