**Acknowledgement**

The authors would like to thank the Director General of Health Malaysia and the Steering Committee Team for supporting the research project through financial grant and technical support. The research team would like to express our gratitude to Director of Education, Ministry of Education Malaysia, Director of Family Health Development Division and Director of Nutrition Division, Ministry of Health Malaysia. Our appreciation also extended to the State Education Department, District Education Office and the selected school officers who assisted in this study successfully. And last but not least we would like to thank the students from all 212 schools for their kind cooperation and participation in this study.

## **TABLE OF CONTENTS**

### **EXECUTIVE SUMMARY**

#### **1.0 Introduction**

- 1.1 Objectives
- 1.2 Variables definition
- 1.3 The NHMS 2017 Organisation Team

#### **2.0 Methodology and Sampling Design**

## **EXECUTIVE SUMMARY**

The National Health & Morbidity Survey: Adolescent Mental Health 2017 is aimed at assessing the prevalence of depression, anxiety and stress including comorbidity and associated factors among secondary school students in Malaysia using self-administered anonymous questionnaires adapted from the Malaysian Global School Health Survey (GSHS) 2012. This study was conducted among secondary school-going adolescents from 26th March to 3<sup>rd</sup> May 2017. In order to ensure national representativeness, this study implemented a two-stage cluster sampling design. Out of 2738 secondary schools from the Ministry of Education and the Ministry of Rural and Regional Development, 212 schools were selected and more than 30,000 students were deemed eligible to participate in this survey. The overall response rate was 89.0% and 27,497 school-going adolescents completed the survey. The prevalence of depression, anxiety and stress were 18.3%, 39.7% and 9.6% respectively. The prevalence of depression was higher among males (18.9%), those of Indian ethnicity (33.1%), and respondents from the state of Selangor (22.6%). The prevalence of anxiety was higher among females (42.3%), those of Bumiputera Sabah ethnicity (47.3%), and respondents from the state of Sabah (46.8%). The prevalence of stress was higher among students studied in urban areas (10.3%), females (10.3%), those of Indian ethnicity (15.3%) and respondents from the state of Selangor (12.5%). Anxiety was found to be the most common mental health problem among Malaysian adolescents, followed by depression and stress. Mental health promotion and prevention strategies should be focused on adolescents and their parents in order to reduce mental health problems in Malaysia.

## 1.0 INTRODUCTION

Anxiety, depression, other mood disorders, behavioural and cognitive disorders are the most common mental health problems among adolescents (Kesler RC et al, 2005). The National Health and Morbidity Survey (NHMS); GSHS 2012 in Malaysia found that the prevalence of suicidal ideation was 7.9% (95% CI:7.27-8.60), suicidal plan was 6.4% (95% CI:5.96-6.88), and attempted suicide was 6.8% (95% CI:6.11-7.52) (IPH, 2012). The NHMS 2011 reported that the prevalence of mental health problems among children and adolescents less than 16 years was 20% as compared to 19.4% in 2006 (IPH, 2006; IPH 2011). The NHMS 2017: Adolescent Health and Nutrition Survey used the Depression, Anxiety, Stress Scale (DASS-21) to determine depression, anxiety, and stress among adolescents aged 13-17 years old.

### 1.1 Objectives

#### 1.1.1 General Objectives:

To determine the prevalence of depression, anxiety, and stress among adolescents aged 13-17 years old.

#### 1.1.2 Specific Objectives

- To determine the prevalence of depression by socio-demography, loneliness, high risk behaviours, being bullied, physical abuse, and verbal abuse.
- To determine the prevalence of anxiety by socio-demography, loneliness, high risk behaviours, being bullied, physical abuse, and verbal abuse.
- To determine the prevalence of stress by socio-demography, loneliness, high risk behaviours, being bullied, physical abuse, and verbal abuse.

### 1.2 Variable Definitions

- Mental health is a state of well-being in which a person realises his or her own abilities, can cope with the normal stresses of life, can work productively, and is able to make a contribution to his or her own community. Poor mental health can be due to depression, anxiety, and stress; where depression and anxiety are the two most common mental health disorders in the community. (WHO, 2016)

- Depression is a common mental disorder, characterized by persistent sadness, loss of interest or pleasure, feeling of guilt or low self-worth, disturbed sleep or appetite, feelings of tiredness, and poor concentration (WHO,2017). Depression was suspected with severity score of more than 13.
- Anxiety is a feeling of unease such as worry or fear that can be mild or severe. Anxiety was suspected with severity score of more than 9.
- Stress is a physical, mental or emotional factor that causes bodily or mental tension. Stress was suspected with severity score of more than 18.
- DASS 21 is a 21-item scale which is used to determine depression, anxiety and stress.

### **1.3 The NHMS 2017 Organisation Team**

The organisation of NHMS 2017 was set up to conduct this survey at various levels of the Ministry of Health and the Ministry of Education.

#### **1.3.1 NHMS Steering Committee**

The NHMS Steering Committee, chaired by the Director- General of Health Malaysia was set up at the national level to determine the scopes of NHMS 2017 and to facilitate the implementation of the survey. The members and terms of reference of this committee are shown in **Appendix 2**.

#### **1.3.2 Central Coordinating Team (CCT)**

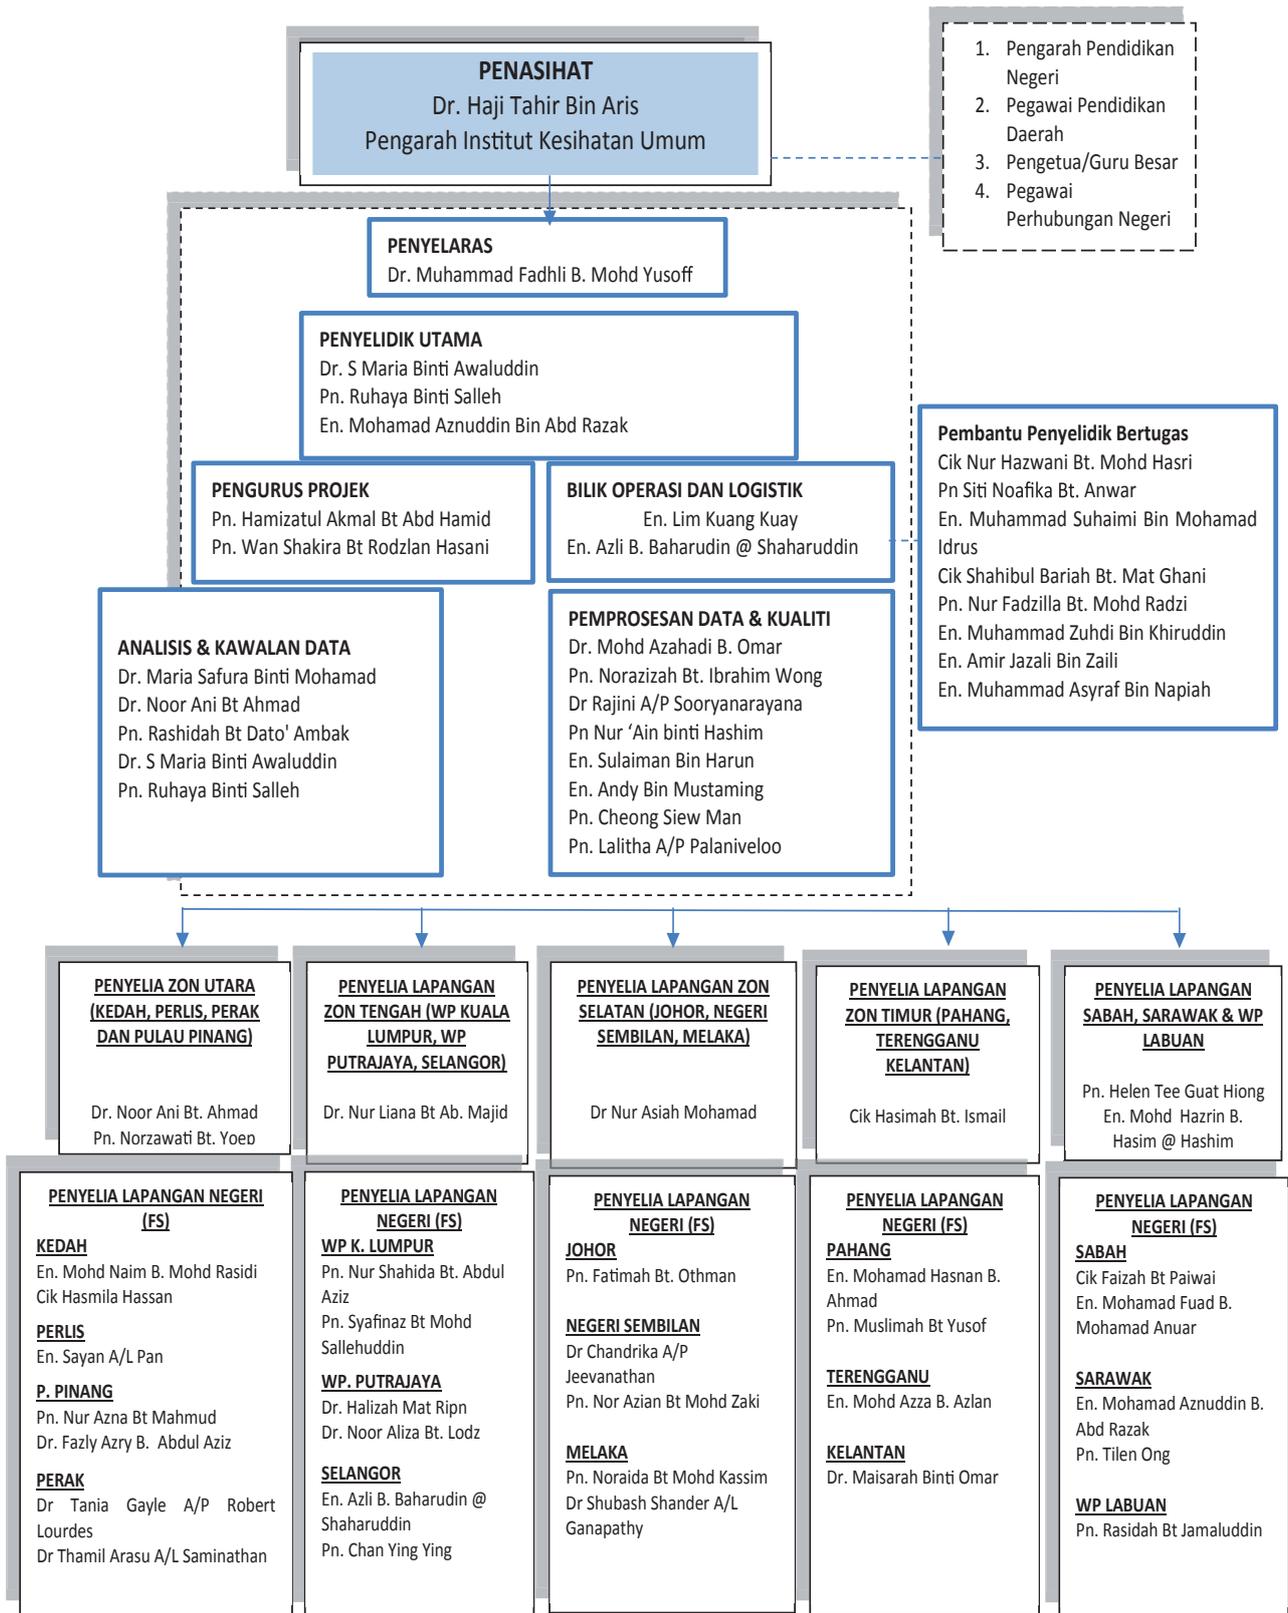

A working committee within the Institute for Public Health was established to coordinate the implementation of the survey according to the scheduled Gantt chart. The Operation Centre was set up as a base by the CCT for coordinating and monitoring the progress of the survey. The CCT members and terms of reference are shown in **Appendices 4 and 5**. Figure 1 shows the organisation chart at the Institute for Public Health level. Adolescent Mental Health (DASS-21) is part of NHMS 2017 using sample from secondary schools only.

#### **1.3.3 Research Team Members**

There were research team members for each sub-topic under the NHMS, with a Chairperson (acting as the Principal Investigator) and Key-person (IPH officer as the co-Principal Investigator). The research team was responsible for the technical input for development of the manual to assist during data collection. The members of the Adolescent Mental Health research teams are shown in **Appendix 6**.

#### **1.3.4 State Liaison Officers**

State Liaison Officer was appointed from each state to facilitate in the planning and implementation of data collection. The list of State Liaison Officers and terms of reference are shown in **Appendix 7**.

**Figure 1: NHMS 2017 Data Collection Teams**

## 2.0 METHODOLOGY AND SAMPLING DESIGN

### 2.1 Target Population

The Adolescent Mental Health (DASS-21) Survey 2017 target population was school-going adolescents aged 13 to 17 years in Malaysia. An equal sample proportion from 16 states including three federal territories in Malaysia to represent adolescents by state.

### 2.2 Sampling Frame

The sampling frame used in this survey was the list of secondary schools from the Ministry of Education and Ministry of Rural and Regional Development. Students' enrolment data of 2016 from Form 1 until Form 5 (secondary school) from the total of 2738 secondary schools were used.

### 2.3 Sample Size Determination

Sample size was calculated using a single proportion formula for estimation of prevalence.

$$n_{\text{SRS}} \geq \frac{Z_{\alpha/2}^2 (p)(1-p)}{e^2}$$

The sample size calculation was based on a few criteria as below:

1. Variance of proportion of the variable of interest (Based on Global School-Based Student Health Survey 2012)
2. Margin of error (e) (Between 0.01 to 0.05)
3. Confidence Interval of 95%

To ensure optimum sample size, a few adjustments were made as follows:

1. Adjusted  $n(srs)$  for the total number of target population ( $N$ ) (based on the population size for schoolchildren in 2016)

$$n \geq \frac{n_{SRS}}{1 + \frac{n_{SRS}}{N}}$$

2. Adjusted for the design effect (deff) (based on previous survey: GSHS 2012),  $n(\text{complex}) = n * \text{deff}$
3. Adjusted the  $n(\text{complex})$  taking into account expected non-response rate of 25%,  $n(\text{adj}) = n(\text{complex}) * (1 + \text{non-response rate})$
4. The sample size was then adjusted according to the need of the analysis, whether the estimate was going to be done at the national or the state level.

Based on the requirements for the objectives and above-mentioned considerations, the optimum sample size required was 212 secondary schools (**Table 2.1**).

**Table 2.1: Distribution of Secondary Schools Sampled by State, NHMS 2017**

No.	State	Total Number of Schools	Number of Schools Sampled	Number of students sampled
1	Johor	306	14	1906
2	Kedah	219	14	1906
3	Kelantan	193	14	1906
4	Melaka	87	14	1906
5	Negeri Sembilan	139	14	1906
6	Pahang	209	14	1906

11	Terengganu	162	14	1906
12	Sabah	246	14	1906
13	Sarawak	220	14	1906
14	WP Kuala Lumpur	133	14	1906
15	WP Labuan	19	8	1906
16	WP Putrajaya	11	8	1906
<b>Total</b>		<b>2,738</b>	<b>212</b>	<b>30496</b>

## **2.4 Sampling Design**

This survey implemented a two-stage stratified cluster sampling design to ensure national representative of students in Forms 1 to 5 (13-17 years). Malaysia was stratified into 16 states (including Federal Territory of Kuala Lumpur, Putrajaya, and Labuan). The first stage of sampling was the selection of secondary schools (students Forms 1 to 5). Schools were selected randomly with probability proportionate to the school enrolment size. A total of 212 secondary schools were selected to participate in this survey. The second stage of sampling was the selection of classes. All classes in each selected school were included in the sampling frame. Systematic random sampling was used to select classes from each selected school. All students in the selected classes were eligible to participate in the survey.

## **2.5 Ethical Approval**

Ethical approval was obtained from the Ministry of Health, Medical Research and Ethics Committee and Ministry of Education Ethics Committee. Approval was also obtained from the relevant authorities at state, district, and school levels. Prior to the survey, several meetings with the relevant Ministry of Education officers and persons-in-charge at the selected schools were conducted to ensure logistic preparation readiness. The parental consent form was explained to the teachers, who will then distribute these further to the parents. Students whose parents did not consent to the survey were considered non-responders.

## **2.6 Survey Instruments**

Validated self-administered bilingual DASS-21 questionnaires with computer-scannable answer sheets were used. Questionnaires were answered anonymously, thereby ensuring the students' privacy. The majority of students completed the survey within two learning periods.

## **2.7 Data Collection**

A total 36 teams were set up, 4 teams for Sabah and Sarawak and 2 teams per state for the rest. Each team consisted of a field supervisor, research assistants, and a driver. The field supervisor was a permanent staff in the Ministry of Health.

An initial data collection by the core team members was initiated to observe the flow of data collection on 06 February 2017. The data collection training was conducted in Kuala Lumpur (for Peninsular Malaysia) and in Kuching, Sarawak (for Sabah, Sarawak and WP Labuan) simultaneously over the duration of 1 week. The training module was prepared by the core team members, covering all aspects of the questionnaire and also included a role-play session on conducting the survey in a classroom or school hall. The actual data collection was conducted from 26 March to 03 May 2017.

## **2.8 Data Management**

Quality check for the data was conducted throughout the survey based on the specific identification (ID) number from the state ID until individual student ID. Upon completing the survey, each answer sheet was put in its individual envelope by the students. All answer sheets from the same school were wrapped together in a bundle. The bundle was either collected in person by the designated drivers (for Peninsular Malaysia) or posted via registered mail (for Sabah, Sarawak and WP Labuan).

### **2.8.1 Data Operation Centre**

The operation centre was set up in order to receive the data from field and consisted of several stations:

Station 1: Checking respondent IDs

Station 2: Scanning

Station 3: Verification

Station 4: Storage

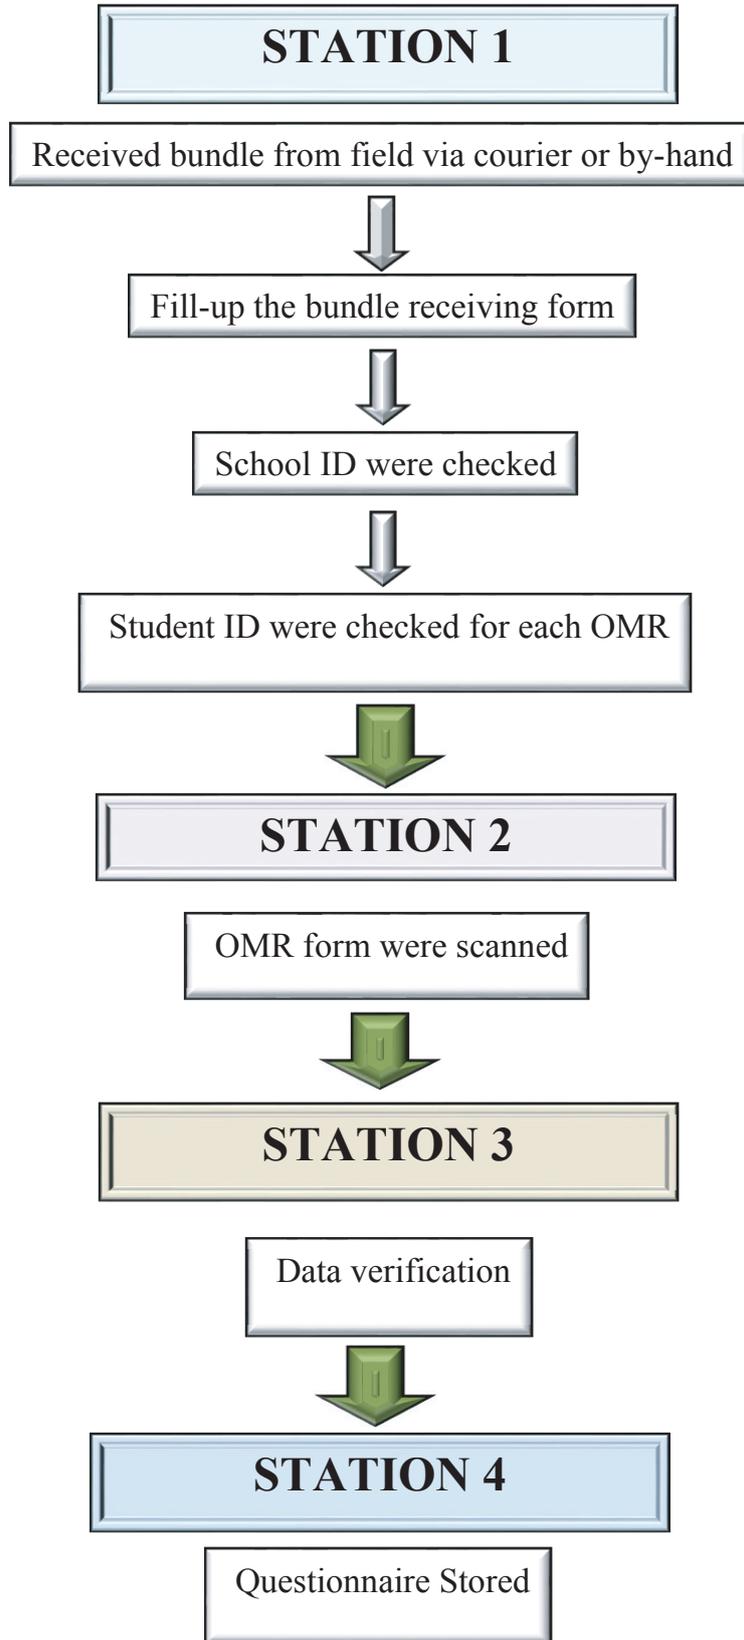

Figure 2: Work flow of NHMS 2017

### 2.8.2 Data Analysis

The data set was checked, cleaned and edited for inconsistencies. Data analysis was conducted using IBM SPSS Version 20.0.

A weighting factor was applied to each student record to adjust for non-response and for the varying probabilities of selection. The weight used for estimation is given by:

$$W = W1 \times W2 \times F \times PS$$

Where;

W1 = the inverse of the probability of selecting the school

W2 = the inverse of the probability of selecting the class within the school

F = the inverse of a school, class and student level non-response adjustment factor

PS = a post stratification adjustment factor calculated by class and gender

The weighted results can be used to make important inferences about the priority health risk behaviours and protective factors of all students in Forms 1 to Form 5.

### 3.0 RESULTS

#### 3.1 General Findings

From a total of 212 selected schools, 27,497 questionnaires were completed by the students. The school and class response rate was 100% respectively, while the student response rate was 89.2%. The overall response rate was 89.2% (**Table 3.1.1**).

The comparison of total estimated population (weighted) with the total secondary school enrolment was shown in Table 3.1.2. The GIS mapping of the selected secondary schools as in Figure 3.

**Table 3.1.1: Response Rate at Student Level by State, NHMS 2017**

### 3.2 Depression

Overall, the prevalence of depression among adolescents was 18.3% (95% CI:17.20-19.38) **(Table 3.3.1)**. The prevalence of depression was highest in Selangor at 22.6% (95% CI:18.83-26.95), urban schools 19.2% (95% CI:17.55-20.91), males 18.9% (95% CI:17.59-20.24), Form 1 students [21.4% (95% CI: 19.12-23.97)], those of Indian ethnicity 33.1% (95% CI:29.12-37.25), and in respondents whose parents were separated 30.1% (95% CI:24.65-36.28) **(Table 3.3.1)**. Amongst those who felt lonely most of the time or always during the past 12 months, 46.7% (95% CI:43.77-49.67) of them have depressive symptoms **(Table 3.3.2)**. The prevalence of respondents with depressive symptoms was 29.7% (95% CI:26.65-33.00) among those who smoked cigarettes on one or more days during the past 30 days; and the prevalence of respondents with depressive symptoms was 36.6% (95% CI:32.69-40.65) among those who drank at least 1 drink containing alcohol on one or more days during the past 30 days **(Table 3.3.3)**. About 60.3% (95% CI:53.7-66.58) of those who used marijuana, and 35.5% (95% CI:31.91-39.29) of those who engaged in sexual activity, had depressive symptoms **(Table 3.3.3)**. The prevalence of depression among those who were bullied, physically abused, and verbally abused were 35.0% (95% CI:32.18-37.92), 37.7%(95% CI:34.48-41.03), 24.6% (95% CI:23-26.26) respectively **(Table 3.3.4)**.

### 3.3 Anxiety

Generally, the prevalence of anxiety among adolescents aged 13-17 years was 39.7% (95% CI:38.39-41.06). The prevalence of anxiety was highest in Sabah at 46.8% (95% CI:43.01-50.68), urban schools 40.1% (95% CI:38.02-42.25), females 42.3% (95% CI:40.66-44.01), Form 1 students, 41.9% (95% CI:39.23-44.62), those of Bumiputra Sabah ethnicity 47.3% (95% CI:42.66-52.05), and in respondents whose parents were separated 50.1% (95% CI:43.19-57.03) **(Table 3.4.1)**. About 63.8% (95% CI:60.60-66.85) of those who felt lonely most of the time or always during the past 12 months reported having anxiety symptoms **(Table 3.4.2)**. The prevalence of respondents with anxiety symptoms was 47.3% (95% CI:44.45-50.07) among those who smoked cigarettes on one or more days during the past 30 days; and the prevalence of respondents with anxiety symptoms was 52.5% (95% CI:48.91-56.15) among those who drank at least 1 drink containing alcohol on one or more days during the past 30

days (**Table 3.4.3**). Among those who used marijuana and engaged in sexual activity, the prevalence of anxiety symptoms was 74.0% (95% CI:68.26-79.1) and 52.1% (95% CI:48.53-55.73) respectively (**Table 3.4.3**). The prevalence of anxiety was reported to be 58.5% (95% CI:55.83-61.18) among those who were bullied, 58.9%(95% CI:55.78-61.85) among those who were physically abused, and 49.7% (95% CI:47.97-51.52) among those who were verbally abused (**Table 3.4.4**).

### 3.4 Stress

The prevalence of stress was 9.6% (95% CI:9.03-10.25). The prevalence of stress was highest in Selangor at 12.5% (95% CI:10.36-15.05), urban schools 10.3% (95% CI:9.32-11.27), females 10.3% (95% CI:9.46-11.17), Form 1 students 11.0% (95% CI: 9.56-12.56), those of Indian ethnicity 15.3% (95% CI:12.91-18.12), and in respondents whose parents were separated 14.9% (95% CI:11.2-19.65) (**Table 3.5.1**). About 28.8% (95% CI:26.72-30.95) of respondents who felt lonely most of the time or always during the past 12 months admitted to having stress symptoms (**Table 3.5.2**). The prevalence of respondents with stress symptoms was 13.7% (95% CI:12.00-15.68) among those who smoked cigarettes on one or more days during the past 30 days; and the prevalence of respondents with stress symptoms was 17.4% (95% CI:15.50-19.46) among those who drank at least 1 drink containing alcohol on one or more days during the past 30 days (**Table 3.5.3**). The prevalence of stress symptoms was 26.8% (95% CI:22.91-30.98) for those who used marijuana, and 17.2% (95% CI:14.71-20.09) for those who engaged in sexual activity (**Table 3.5.3**). Among those who were being bullied, physically abused and verbally abused, 19.1% (95% CI:17.58-20.73), 18.7%(95% CI:17.02-20.47), and 13.7% (95% CI:12.67-14.7) had stress symptoms respectively (**Table 3.5.4**).

### 3.5 Morbidity Status

Based on **Tables 3.6.1, 3.6.2** and **3.6.3**, Sabah had the highest prevalence of at least one and two conditions at 50.1%(95% CI:45.77-54.43) and 23.3% (95% CI:19.94-26.94), respectively compared to the other states; whereas Selangor had the highest prevalence of three conditions at 8.4% (95% CI:6.85-10.18). Females had higher prevalence of at least one condition at 45.7% (95% CI:43.94-47.38) and three conditions at 6.3% (95% CI:5.67-6.97)

compared to males; while males had higher prevalence of at least two conditions at 17.8% (95% CI:16.41-19.25). Form 1 students had the highest prevalence of at least two conditions and three conditions at 20.9% (95% CI:18.67-23.26) and 6.8% (95% CI:5.83-7.89) respectively, compared to other forms. Form 4 students had the highest prevalence of at least one condition at 45.2% (95% CI:42.95-47.47). Among the different ethnic groups, Indians had the highest prevalence of at least one, two and three conditions at 52.6% (95% CI:48.52-56.74), 29.9% (95% CI:25.53-34.75), and 11.1% (95% CI:9.24-13.34) respectively. Among all the parents' marital status, respondents with separated parents had the highest prevalence of at least one and two conditions at 54.2% (95% CI:46.99-61.29), and 29.6% (95% CI:24.16-35.77), respectively. Respondents with unknown parents' marital status had the highest prevalence of three conditions at 10.6% (95% CI:7.78-14.2).

#### **4.0 Discussion**

In this current NHMS 2017 Adolescent Mental Health Survey using the DASS-21, the prevalence of depression was 18.3% (95% CI:17.20-19.38), anxiety 39.7% (95% CI:38.39-41.06), and stress 9.6% (95% CI:9.03-10.25).

The previous NHMS 2012 Mental Health of Adolescents Survey also used the DASS-21. This previous study involved 24,708 students aged 13-17 years old. The prevalence of depression, anxiety and stress found here was 17.7% (95%CI: 16.71-18.67), 39.6% (95% CI: 38.23-41.06), and 10.1% (95% CI: 9.53-10.67), respectively. This current survey (NHMS 2017) had a slightly higher prevalence of depression (18.3%) and anxiety (39.7%) compared to the NHMS 2012 findings for depression and anxiety. However, the prevalence of stress (9.6%) was slightly lower than the NHMS 2012 findings.

#### **4.1 Depression**

There may be several reasons for the increase in the prevalence of depression in this current NHMS 2017 as compared to the NHMS 2012 findings. In the NHMS 2017, about 46.7% (95% CI:43.77-49.67) of respondents who felt lonely most of the time or always during the past 12 months had depressive symptoms. This result is almost 2.5 times higher compared to the

NHMS 2012, where only 19.0% (95% CI 17.4-20.7) of respondents who felt lonely most of the time or always during the past 12 months with depressive symptoms.

As for the prevalence of depressive symptoms among those who smoked cigarettes on one or more days during the past 30 days, the NHMS 2017 results was 29.7% (95% CI:26.65-33.00) which increased by two-fold compared to the NHMS 2012 at 15.1% (95% CI 13.4-16.9). The prevalence of respondents with depressive symptoms among those who drank at least 1 drink containing alcohol on one or more days during the past 30 days at 36.6% (95% CI:32.69-40.65) in the NHMS 2017 was 2.6 times higher compared to the NHMS 2012 at 14.1% (95% CI 12.2-16.2). In the NHMS 2017, 60.3% (95% CI:53.7-66.58) of those who use marijuana had depressive symptoms. This finding is rather alarming because it shows an upsurge of 18 times in the NHMS 2017 results compared to the NHMS 2012 findings at 3.3% (95% CI 2.5-4.2). Another area of concern is the prevalence of depressive symptoms among those who had sexual activity. This was 35.5% (95% CI:31.91-39.29) in the NHMS 2017 survey, which was a 3-fold increase compared to the NHMS 2012 findings at 12.0% (95% CI 10.7-13.5). In the NHMS 2017, about 35% (95% CI:32.18-37.92) of those who being bullied had depressive symptoms; and this result was also higher compared to the NHMS 2012 findings at 29.7% (95% CI 27.3-32.2).

#### **4.2 Anxiety**

The prevalence of anxiety in NHMS 2017 was found to be on the up-going trend compared to survey done in NHMS 2012. Based on NHMS 2017, 63.8% (95% CI: 60.6-66.85) of respondents who felt lonely most of the time or always during the past 12 months had anxiety symptoms. This result is 5 times higher compared to the NHMS 2012, where only 12.2% (95% CI 11.3-13.3) of those felt lonely most of the time or always during the past 12 months had anxiety symptoms.

As for the prevalence of anxiety symptoms among those who smoked cigarettes on one or more days during the past 30 days, the NHMS 2017 results was 47.3% (95% CI:44.45-50.07) which jump up by 3 times higher compared to the NHMS 2012 at 12.5% (95% CI 11.1-14). The prevalence of respondents with anxiety symptoms among those who drank at least 1 drink

containing alcohol on one or more days during the past 30 days at 52.5% (95% CI:48.91-56.15) in the NHMS 2017 escalated by five times compared to the NHMS 2012 at 10.2% (95% CI 8.9-11.7). In the NHMS 2017, 74% (95% CI:68.26-79.10) of those who used marijuana had anxiety symptoms. This finding is highly alarming because it shows an upsurge of 38 times in the NHMS 2017 results compared to the NHMS 2012 findings at 1.9% (95% CI 1.5-2.5). Another area of concern is the prevalence of anxiety symptoms among those who had sexual activity. This was 52.1% (95% CI:48.53-55.73) in the NHMS 2017 survey, which was a 5-fold increase compared to the NHMS 2012 findings at 9.7% (95% CI 8.7-10.8). In the NHMS 2017, about 58.5% (95% CI:55.83-61.18) of those who were bullied had anxiety symptoms; and this result was also higher by almost 2 folds compared to the NHMS 2012 findings at 23.8% (95% CI 22.3-25.4).

### **4.3 Stress**

Surprisingly, the prevalence of stress was slightly reduced in the NHMS 2017 compared to NHMS 2012. From the analysis done, this could be due to the decrease in prevalence of those with stress and smoking cigarettes on one or more days during the past 30 days. The prevalence was 14.2% (95% CI 12.4-16.2) in NHMS 2012 which reduced to 13.7% in NHMS 2017. The prevalence of stress symptoms among those who had been bullied in the past 30 days was also markedly reduced from 28.3% (95% CI 25.7-31) in NHMS 2012 to 19.1%(95% CI 17.58-20.73) in NHMS 2017.

## **Conclusion**

Selangor had the highest prevalence of depression and stress, whereas Sabah had the highest prevalence of anxiety. Males had higher prevalence of depression, while females had higher prevalence of both anxiety and stress. Form 1 students had the highest prevalence of all three conditions. Respondents of Indian ethnicity had the highest prevalence of depression and stress, whereas those of Bumiputra Sabah ethnicity had the highest prevalence of anxiety. Respondents whose parents were separated had the highest prevalence of depression, anxiety and stress. Depression, anxiety and stress were highest among respondents who felt lonely, smoked cigarettes, drank alcohol, used marijuana, had sexual behaviour, were bullied and had experienced physical abuse.

Compared to the NHMS 2012, there was an increase in the prevalence for depression and anxiety symptoms in NHMS 2017. However, there was a decrease in the prevalence for stress symptoms. Several factors have been identified, mainly loneliness, cigarette smoking, alcohol use, marijuana use, sexual behaviour and having been bullied.

## **Recommendations**

Efforts should be made to inform our community of all these findings. Public health campaigns, education and awareness programmes should be conducted to increase the knowledge and awareness of depression, anxiety and stress among adolescents in Malaysia. Factors associated with higher prevalence of depression, anxiety, and stress as found in this study such as feeling lonely, smoking cigarettes, drinking alcohol, using marijuana, engaging in sexual activity, being bullied and having prior experience of physical abuse as well as verbal abuse should be highlighted and addressed accordingly. These programmes can be conducted in schools, clinics and the community. Intervention programmes to reduce the prevalence and severity of these problems should target not only the children and adolescents, but also their parents, teachers and the community as a whole. In view of many recent cases of abuse and bullying, including deaths and suicides, these issues need to be tackled urgently.

78.8	Saya rasa saya menggunakan banyak tenaga dalam keadaan cemas <i>I felt that I was using a lot of nervous energy</i>	a	b	c	d
78.9	Saya bimbang keadaan di mana saya mungkin menjadi panik dan melakukan perkara yang membodohkan diri sendiri <i>I was worried about situation in which I might panic and make a fool of myself</i>	a	b	c	d
78.10	Saya rasa saya tidak mempunyai apa-apa untuk diharapkan <i>I felt that I had nothing to look forward to</i>	a	b	c	d
78.11	Saya mendapati diri saya semakin gelisah <i>I found myself getting agitated</i>	a	b	c	d
78.12	Saya rasa sukar untuk relaks <i>I found it difficult to relax</i>	a	b	c	d
78.13	Saya rasa sedih dan murung <i>I felt down-hearted and blue</i>	a	b	c	d
78.14	Saya tidakdapat menahan sabar dengan perkara yang menghalang saya meneruskan apa yang saya lakukan <i>I was intolerant of anything that kept me from getting on with what I was doing</i>	a	b	c	d

78.15	Saya rasa hampir-hampir menjadi panik/cemas <i>I felt I was close to panic</i>	a	b	c	d
78.16	Saya tidak bersemangat dengan apa jua yang saya lakukan <i>I was unable to become enthusiastic about anything</i>	a	b	c	d
78.17	Saya tidak begitu berharga sebagai seorang individu <i>I felt I wasn't worth much as a person</i>	a	b	c	d
78.18	Saya rasa yang saya mudah tersentuh <i>I felt that I was rather touchy</i>	a	b	c	d
78.19	Saya sedar tindakbalas jantung saya walaupun tidak melakukan aktiviti fizikal (contohnya kadar denyutan jantung bertambah, atau denyutan jantung berkurangan) <i>I was aware of the action of my heart in the absence of physical exertion (e.g. sense of heart rate increase, heart missing a beat)</i>	a	b	c	d
78.20	Saya berasa takut tanpa sebab yang munasabah <i>I felt scared without any good reason</i>	a	b	c	d
78.21	Saya rasa hidup ini tidak bermakna <i>I felt that life was meaningless</i>	a	b	c	d

***Introduction***

The DASS 21 is a 21 item self-report questionnaire designed to measure the severity of a range of symptoms common to both Depression and Anxiety. In completing the DASS, the individual is required to indicate the presence of a symptom over the previous week. Each item is scored from 0 (did not apply to me at all over the last week) to 3 (applied to me very much or most of the time over the past week).

The essential function of the DASS is to assess the severity of the core symptoms of Depression, Anxiety and Stress. Accordingly, the DASS allows not only a way to measure the severity of a patient's symptoms but a means by which a patient's response to treatment can also be measured.

***The DASS and Diagnosis***

Although the DASS may contribute to the diagnosis of Anxiety or Depression, it is not designed as a diagnostic tool. Indeed, a number of symptoms typical of Depression such as sleep, appetite and sexual disturbances, are not covered by the DASS and will need to be assessed independently. The DASS is not meant to replace a comprehensive clinical interview.

***Suicide***

Suicidality is not assessed by the DASS. Accordingly, the clinician will need to address directly this important symptom of Depression in their clinical interview.

***How often to use the DASS?***

Although the DASS can provide a comparison of symptoms from week to week, it is best given on first presentation and again after a period of time has lapsed long enough for the chosen treatment to have effect. In the case of antidepressant medication, the second administration should be between the 2-4 weeks period after the individual has commenced taking the medication. This period is long enough for most antidepressants to be expected to show some change in the patient.

**Scoring the DASS**

The scale to which each item belongs is indicated by the letters D (Depression), A (Anxiety) and S (Stress). For each scale (D, A & S) sum the scores for identified items. Because the DASS 21 is a short form version of the DASS (the Long Form has 42 items), the final score of each item groups (Depression, Anxiety and Stress) needs to be multiplied by two (x2).

**Interpreting the DASS**

Once multiplied by 2, each score can now be transferred to the DASS profile sheet, enabling comparisons to be made between the three scales and also giving percentile rankings and severity labels.

**DASS Severity Ratings**

(Don't forget to multiply summed scores by x 2)

Severity	Depression	Anxiety	Stress
Normal	0-9	0-7	0-14
Mild	10-13	8-9	15-18
Moderate	14-20	10-14	19-25
Severe	21-27	15-19	26-33
Extremely Severe	28+	20+	34+

As previously mentioned, the DASS should not be used on its own to assess the presence or absence of Depression or Anxiety. High scores on the DASS would certainly alert the clinician to a high level of distress in the patient and this would need to be explored further within the interview process. Similarly, low scores on the DASS should not be a substitute for a comprehensive clinical interview.

High DASS scores which are not changing, may prompt the clinician to look for explanations and perhaps augment dosages or change medication. Here again, the DASS should be interpreted alongside the clinical interview.

Changes in scores in one scale (EG: Depression), with consistently high and unchanging scores in another scale (Anxiety) may alert the clinician to pay particular attention to the presence of a coexisting anxiety disorder which may need specific treatment in its own right.

Similarly, decreasing Depression scores alongside unchanging Stress scores may alert the clinician to the presence of some life event or problem, which may need to be addressed directly.
